## Memory, Data, \& Addressing II

## CSE 351 Winter 2019

Instructors:
Max Willsey
Luis Ceze

Teaching Assistants:
Britt Henderson
Lukas Joswiak
Josie Lee
Wei Lin
Daniel Snitkovsky
Luis Vega
Kory Watson
Ivy Yu

MAN, I SUCK AT THIS GAME.
CAN YOU GIVE ME A FEW POINTERS?

http://xkcd.com/138/

## Administrivia

* Lab 0 due Monday 1/14 @ 11:59 pm
- You will be revisiting this program throughout this class!
* Homework 1 due Wednesday
- Reminder: autograded, 20 tries, no late submissions
* Lab 1a released today
- Pointers in C
- Reminder: last submission graded, individual work

## Late Days

* All submissions due at 11:59 pm
- Count lateness in days (even if just by a second)
- Special: weekends count as one day
- No submissions accepted more than two days late
* You are given 5 late day tokens for the whole quarter
- Tokens can only apply to Labs (not HW)
- No benefit to having leftover tokens
* Late penalty is $20 \%$ deduction of your score per day
- Only late labs are eligible for penalties
- Penalties applied at end of quarter to maximize your grade
* Use at own risk - don't want to fall too far behind
- Intended to allow for unexpected circumstances

## Review Questions

1) If the word size of a machine is 64-bits, which of the following is usually true? (pick all that apply)
a) 64 bits is the size of a pointer
b) 64 bits is the size of an integer
c) 64 bits is the width of a register
2) (True/False) By looking at the bits stored in memory, I can tell if a particular 4-bytes is being used to represent an integer, floating point number, or instruction.
3) If the size of a pointer on a machine is 6 bits, the address space is how many bytes?

## Memory, Data, and Addressing

* Representing information as bits and bytes
* Organizing and addressing data in memory
* Manipulating data in memory using C
* Boolean algebra and bit-level manipulations

## Addresses and Pointers in C

int $y=2$;
int* $\mathrm{ptr} ;$
int $\mathrm{X}=5$;
int $\mathrm{y}=2 ;$
ptr $=\& x ;$

Declares a variable, ptr, that is a pointer to
(i.e. holds the address of) an int in memory

Declares two variables, x and y , that hold ints, and initializes them to 5 and 2, respectively operator

*     * = "value at address" or "dereference" operator
Declares a variable, ptr, that is a pointer to
(i.e. holds the address of) an int in memory

Sets $p$ tr to the address of $x$ ("ptr points to x ")

Sets $y$ to " 1 plus the value stored at the address held by ptr. Because ptr points to $x$, this is equivalent to $y=1+x$;

[^0]
## Assignment in C

* A variable is represented by a location
* Declaration $\neq$ initialization (initially holds "garbage")
* int $x, y$;
- x is at address $0 x 04, \mathrm{y}$ is at 0 x 18

|  | 0x00 | 0x01 | 0x02 | 0x03 |
| :---: | :---: | :---: | :---: | :---: |
| 0x00 | A7 | 00 | 32 | 00 |
| $0 \times 04$ | 00 | 01 | 29 | F3 |
| $0 \times 08$ | EE | EE | EE | EE |
| 0x0C | FA | CE | CA | FE |
| $0 \times 10$ | 26 | 00 | 00 | 00 |
| $0 \times 14$ | 00 | 00 | 10 | 00 |
| $0 \times 18$ | 01 | 00 | 00 | 00 |
| 0x1C | FF | 00 | F4 | 96 |
| $0 \times 20$ | DE | AD | BE | EF |
| 0x24 | 00 | 00 | 00 | 00 |

## Assignment in C

little-endian

* A variable is represented by a location
* Declaration $=$ initialization (initially holds "garbage")
* int $x, y$;
- x is at address $0 \mathrm{x} 04, \mathrm{y}$ is at 0 x 18

|  | 0x00 | 0x01 | 0x02 | 0x03 |
| :---: | :---: | :---: | :---: | :---: |
| 0x00 |  |  |  |  |
| 0x04 | 00 | 01 | 29 | F3 |

| 0x1C |  |  |  |  |
| 0x20 |  |  |  |  |
| 0x24 |  |  |  |  |

## Assignment in C

* left-hand side = right-hand side;
- LHS must evaluate to a location
- RHS must evaluate to a value (could be an address)
- Store RHS value at LHS location
* int $x, y$;
* $\mathrm{x}=0$;

## Assignment in C

* left-hand side = right-hand side;

- LHS must evaluate to a location
- RHS must evaluate to a value (could be an address)
- Store RHS value at LHS location
* int $x, y$;
* $x=0$;
*y = 0x3CD02700;

## Assignment in C

* left-hand side = right-hand side;
- LHS must evaluate to a location
- RHS must evaluate to a value (could be an address)
- Store RHS value at LHS location
* int $x, y$;
* $x=0$;
: $y=0 x 3 C D 02700$;
$\% x=y+3 ;$
- Get value at y , add 3 , store in x

|  | 0x00 | 0x01 | 0x02 | 0x03 |
| :---: | :---: | :---: | :---: | :---: |
| 0x00 |  |  |  |  |

| 0x08 |  |  |  |  |
| 0x0C |  |  |  |  |
| 0x10 |  |  |  |  |
| $0 \times 14$ |  |  |  |  |
| $0 \times 18$ | 00 | 27 | D0 | 3C |
| 0x1C |  |  |  |  |
| $0 \times 20$ |  |  |  |  |
| 0x24 |  |  |  |  |

## Assignment in C

* = "dereference"
* left-hand side = right-hand side;
- LHS must evaluate to a location
- RHS must evaluate to a value (could be an address)
- Store RHS value at LHS location
* int $x, y ;$
* $x=0$;
* $y=0 x 3 C D 02700 ;$
$\therefore x=y+3$;
- Get value at y , add 3 , store in x
* int* z ;
- z is at address $0 \times 20$

|  | 0x00 | 0x01 | $0 \times 02$ | $0 \times 03$ |
| :---: | :---: | :---: | :---: | :---: |
| 0x00 |  |  |  |  |
| 0x04 | 03 | 27 | D0 | 3C |
| 0x08 |  |  |  |  |
| 0x0C |  |  |  |  |
| 0x10 |  |  |  |  |
| 0x14 |  |  |  |  |
| $0 \times 18$ | 00 | 27 | D0 | 3C |
| 0x1C |  |  |  |  |
| 0x20 | DE | AD | BE | EF |
| $0 \times 24$ |  |  |  |  |

## Assignment in C

* = "dereference"
* left-hand side = right-hand side;
- LHS must evaluate to a location
- RHS must evaluate to a value (could be an address)
- Store RHS value at LHS location
* int $x, y ;$
* $x=0$;
* $y=0 x 3 C D 02700 ;$
$\% \mathrm{x}=\mathrm{y}+3$;
- Get value at y , add 3 , store in x
* int* $\mathrm{z}=\mathrm{E} \mathrm{y}+3$;

|  | 0x00 | 0x01 | 0x02 | 0x03 |
| :---: | :---: | :---: | :---: | :---: |
| 0x00 |  |  |  |  |
| $0 \times 04$ | 03 | 27 | D0 | 3 C |
| $0 \times 08$ |  |  |  |  |
| 0x0C |  |  |  |  |
| 0x10 |  |  |  |  |
| 0x14 |  |  |  |  |
| 0x18 | 00 | 27 | D0 | 3 C |
| $0 \times 1 \mathrm{C}$ |  |  |  |  |
| $0 \times 20$ | 24 | 00 | 00 | 00 |
| 0x24 |  |  |  |  |

- Get address of $y$, "add 3 ", store in $z$

## Pointer Arithmetic

* Pointer arithmetic is scaled by the size of target type
- In this example, sizeof (int) $=\underline{4}$
* int* $\mathrm{z}=\mathrm{E} \mathrm{y}+3$;
- Get address of $y$, add $3 *$ sizeof (int), store in $z$
- $\& y=0 \times 18=1 * 16^{1}+8 * 16^{0}=24$
- $24+3 *(4)=36=2 * 16^{1}+4 * 16^{0}=0 \times 24$
* Pointer arithmetic can be dangerous!
- Can easily lead to bad memory accesses
- Be careful with data types and casting

## Assignment in C

32-bit example (pointers are 32-bits wide)
\& = "address of"

* = "dereference"
* int $x, y$;
* $\mathrm{x}=0$;
*y = 0x3CD02700;
$\% x=y+3 ;$
- Get value at y , add 3 , store in x
* int* $z=\& y+3$;
- Get address of $y$, add 12 , store in $z$
** $\mathrm{Z}=\mathrm{Y}$;
- What does this do?

## Assignment in C

* int $x, y ;$
* $x=0$;
: $y=0 x 3 C D 02700$;
$\% x=y+3 ;$
- Get value at y , add 3 , store in x
$\%$ int* $z=\& y+3 ;$
- Get address of $y$, add 12, store in $z$

- Get value of y , put in address stored in z

32-bit example
(pointers are 32-bits wide)
\& = "address of"

* = "dereference"

|  | 0x00 | 0x01 | 0x02 | 0x03 |

| 0x08 |  |  |  |  |
| 0x0C |  |  |  |  |
| 0x10 |  |  |  |  |
| 0x14 |  |  |  |  |
| $0 \times 18$ | 00 | 27 | D0 | 3C |
| 0x1C |  |  |  |  |
| 0x20 | 24 | 00 | 00 | 00 |
| 0x24 | 00 | 27 | D0 | 3C |

## Arrays in C

Arrays are adjacent locations in memory storing the same type of data object
a (array name) returns the array's address

## Arrays in C

Declaration: int a[6];
Indexing:
$a[0]=0 x 015 f ;$
$a[5]=a[0] ;$
Arrays are adjacent locations in memory storing the same type of data object
a (array name) returns the array's address
\& a [i] is the address of a [0] plus itimes the element size in bytes

## Arrays in C

Declaration: int a[6];
Indexing:
$a[0]=0 x 015 f ;$
$a[5]=a[0] ;$
No bounds checking:
$\mathrm{a}[6]=0 x B A D ;$
$a[-1]=0 \times B A D ;$

Arrays are adjacent locations in memory storing the same type of data object
a (array name) returns the array's address
\& a [i] is the address of a [0] plus itimes the element size in bytes
$a[0]$
$a[2]$
$a[4]$

$$

(A) $10110 \quad 5 \quad 10$ then $10111 \quad 5 \quad 11$
(B) $10410 \quad 5 \quad 10$ then $10411 \quad 5 \quad 11$
(C) $100 \quad 6 \quad 6 \quad 10$ then 101
(D) 100 6 6 10 then 104 6 6 10

## Representing strings

* C-style string stored as an array of bytes (char*)
- Elements are one-byte ASCII codes for each character
- No "String" keyword, unlike Java

| 32 | space | 48 | 0 | 64 | @ | 80 | P | 96 |  | 112 | p |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 33 | ! | 49 | 1 | 65 | A | 81 | Q | 97 | a | 113 | q |
| 34 | " | 50 | 2 | 66 | B | 82 | R | 98 | b | 114 | r |
| 35 | \# | 51 | 3 | 67 | C | 83 | S | 99 | c | 115 | s |

ASCII: American Standard Code for Information Interchange

## Null-Terminated Strings

* Example: "Donald Trump" stored as a 13-byte array

| Decimal: | 68 | 111 | 110 | 97 | 108 | 100 | 32 | 84 | 114 | 117 | 109 | 112 | 0 |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $0 \times 44$ | $0 \times 6 \mathrm{~F}$ | $0 \times 6 \mathrm{E}$ | $0 \times 61$ | $0 \times 6 \mathrm{C}$ | $0 \times 64$ | $0 \times 20$ | $0 \times 54$ | $0 \times 72$ | $0 \times 75$ | $0 \times 6 \mathrm{D}$ | $0 \times 70$ | $0 \times 00$ |
| Hext: | D | o | n | a | I | d |  | T | r | u | m | p | $\backslash 0$ |

* Last character followed by a 0 byte (' $\backslash 0^{\prime}$ ) (a.k.a. "null terminator")
- Must take into account when allocating space in memory
- Note that ' 0 ' $\neq$ ' $\backslash 0$ ' (i.e. character 0 has non-zero value)
* How do we compute the length of a string?
- Traverse array until null terminator encountered

## Endianness and Strings

* Byte ordering (endianness) is not an issue for 1-byte values
- The whole array does not constitute a single value
- Individual elements are values; chars are single bytes

## Examining Data Representations

* Code to print byte representation of data
- Any data type can be treated as a byte array by casting it to char
- C has unchecked casts !! DANGER !!

```
void show_bytes(char* start, int len) {
    int i;
    for (i = 0; i < len; i++)
        printf("%p\t0x%.2x\n", start+i, *(start+i));
    printf("\n");
}
```

printf directives:
\%p Print pointer
\t Tab
\%x Print value as hex
\n New line

## Examining Data Representations

* Code to print byte representation of data
- Any data type can be treated as a byte array by casting it to char
- C has unchecked casts !! DANGER !!

```
void show_bytes(char* start, int len) {
    int i;
    for (i = 0; i < len; i++)
        printf("%p\t0x%.2x\n", start+i, *(start+i));
    printf("\n");
}
```

void show_int(int $x$ ) \{
show_bytes ( (char *) \&x, sizeof(int));
\}

## show_bytes Execution Example

```
int x = 12345; / / 0x00003039
printf("int x = %d;\n",x);
show_int(x); // show_bytes((char *) &x, sizeof(int));
```

* Result (Linux x86-64):
- Note: The addresses will change on each run (try it!), but fall in same general range

| int $x=12345 ;$ |  |
| :--- | :--- |
| $0 x 7 f f f b 7 f 71 d b c$ | $0 x 39$ |
| $0 x 7 f f f b 7 f 71 d b d$ | $0 x 30$ |
| $0 x 7 f f f b 7 f 71 d b e$ | $0 x 00$ |
| $0 x 7 f f f b 7 f 71 d b f$ | $0 x 00$ |

## Summary

* Assignment in C results in value being put in memory location
* Pointer is a C representation of a data address
" \& = "address of" operator
-     * = "value at address" or "dereference" operator
* Pointer arithmetic scales by size of target type
- Convenient when accessing array-like structures in memory
- Be careful when using - particularly when casting variables
* Arrays are adjacent locations in memory storing the same type of data object
- Strings are null-terminated arrays of characters (ASCII)

[^0]:    What is * (\&y) ?
