Floating Point II

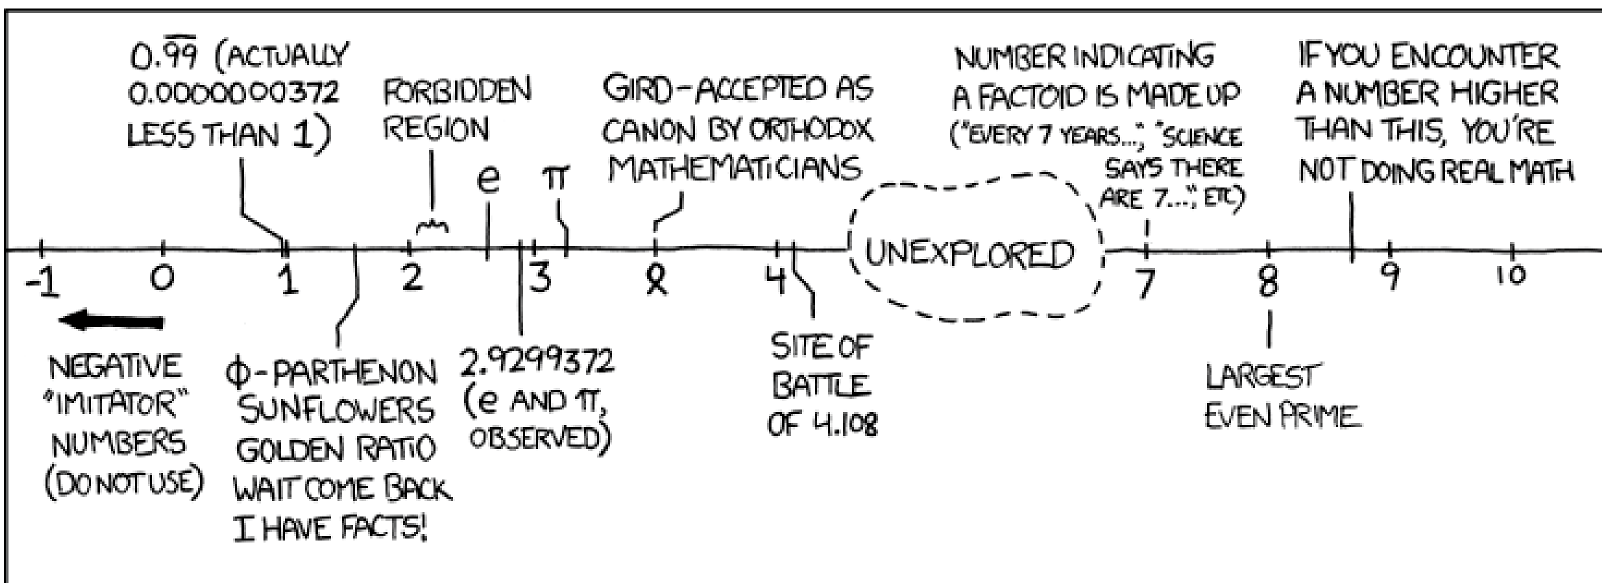
CSE 351 Spring 2020

Instructor:

Ruth Anderson

Teaching Assistants:

Alex Olshanskyy	Callum Walker	Chin Yeoh
Connie Wang	Diya Joy	Edan Sneh
Eddy (Tianyi) Zhou	Eric Fan	Jeffery Tian
Jonathan Chen	Joseph Schafer	Melissa Birchfield
Millicent Li	Porter Jones	Rehaan Bhimani



http://xkcd.com/899/

Administrivia

- Lab 1a due TONIGHT (4/13) at 11:59 pm
  - Submit `pointer.c` and `lab1Areflect.txt`
- hw6 due Wednesday – 11am
- Lab 1b due Monday (4/20)
  - Submit `bits.c` and `lab1Breflect.txt`
- **You must log on with your @uw google account to access!!**
  - **Google doc** for 11:30 Lecture: https://tinyurl.com/351-04-13A
  - **Google doc** for 2:30 Lecture: https://tinyurl.com/351-04-13B
- Week 2 Feedback Survey
  - https://catalyst.uw.edu/webq/survey/rea2000/388285

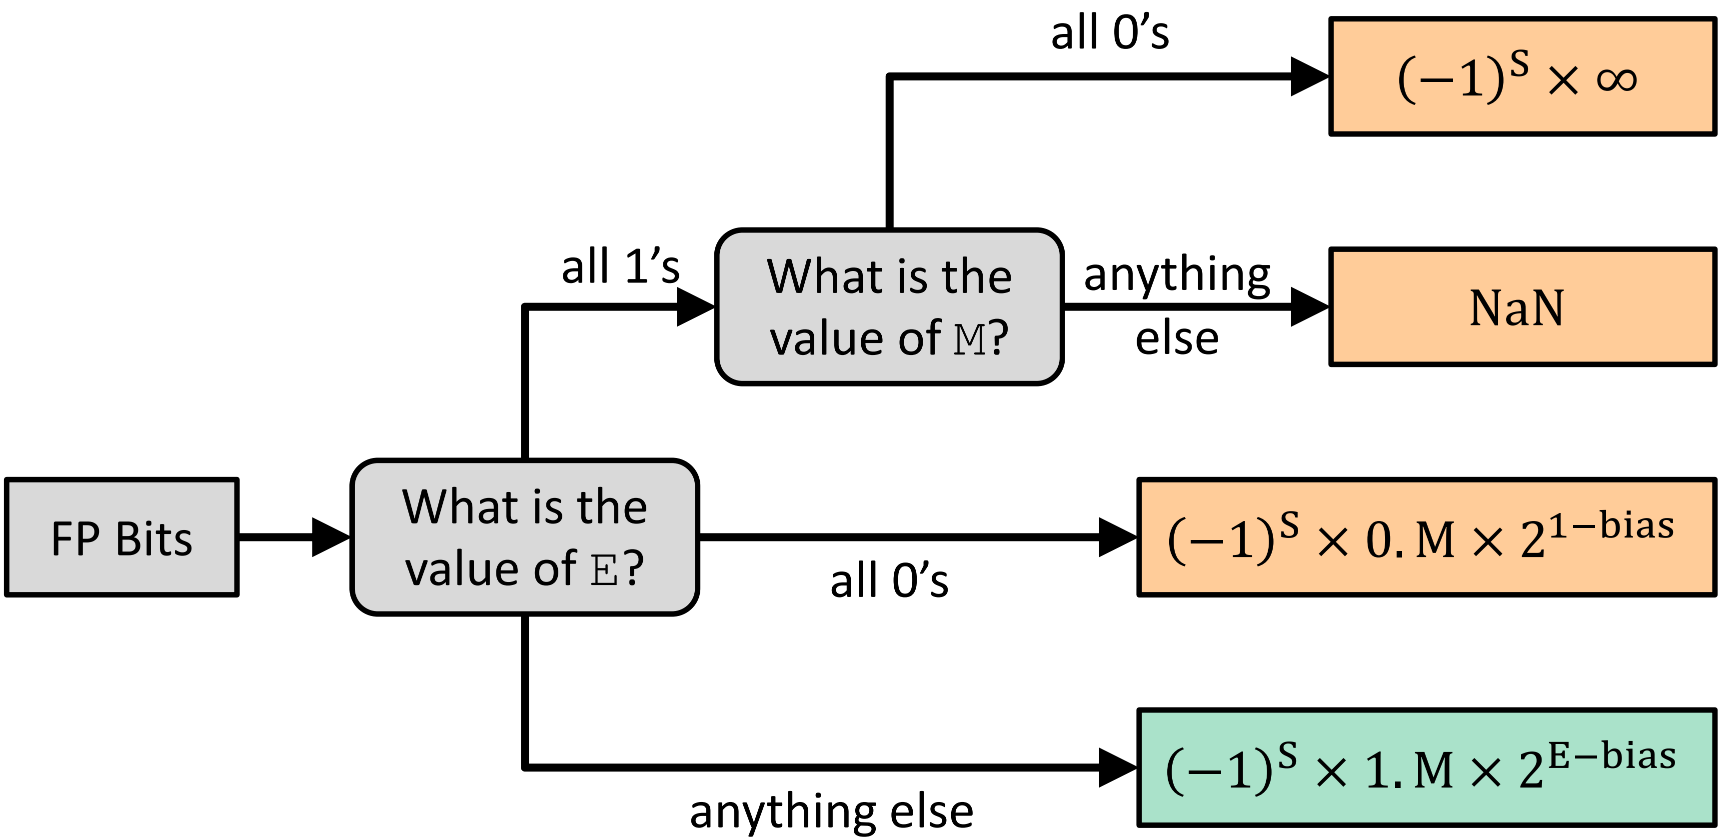
Other Special Cases

- E = 0xFF, M = 0: $\pm\infty$
  - *e.g.* division by 0
  - Still work in comparisons!
- E = 0xFF, M ≠ 0: Not a Number (NaN)
  - *e.g.* square root of negative number, 0/0, $\infty - \infty$
  - NaN propagates through computations
  - Value of M can be useful in debugging
- New largest value (besides ∞)?
  - E = 0xFF has now been taken!
  - E = 0xFE has largest: $1.1\ldots1_2 \times 2^{127} = 2^{128} - 2^{104}$

Floating Point Encoding Summary

`E`	`M`	Meaning
0x00	0	± 0
0x00	non-zero	± denorm num
0x01 – 0xFE	anything	± norm num
0xFF	0	± ∞
0xFF	non-zero	NaN

Floating Point Interpretation Flow Chart



= special case

Floating point topics

- Fractional binary numbers
- IEEE floating-point standard
- **Floating-point operations and rounding**
- Floating-point in C

- There are many more details that we won't cover
  - It's a 58-page standard…

Tiny Floating Point Representation

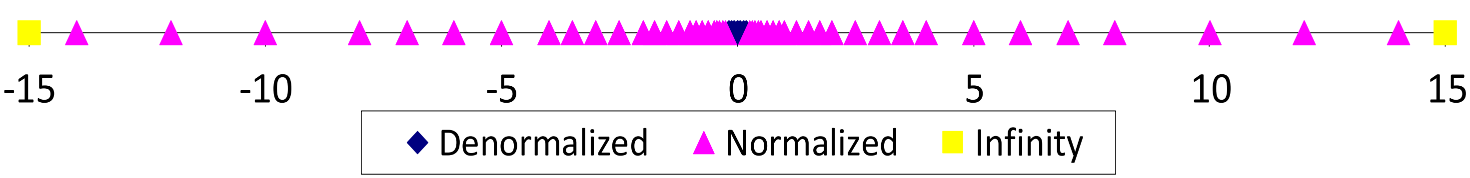
- We will use the following **8-bit** floating point representation to illustrate some key points:

S	E	M
1	4	3

- Assume that it has the same properties as IEEE floating point:
  - bias =
  - encoding of -0 =
  - encoding of $+\infty$ =
  - encoding of the largest (+) normalized # =
  - encoding of the smallest (+) normalized # =

Distribution of Values

- What ranges are NOT representable?
  - Between largest norm and infinity **Overflow** (Exp too large)
  - Between zero and smallest denorm **Underflow** (Exp too small)
  - Between norm numbers? **Rounding**
- Given a FP number, what's the bit pattern of the next largest representable number?
  - What is this "step" when Exp = 0?
  - What is this "step" when Exp = 100?
- Distribution of values is denser toward zero



Floating Point Rounding

This is extra (non-testable) material

- The IEEE 754 standard actually specifies different rounding modes:
  - Round to nearest, ties to nearest even digit
  - Round toward $+\infty$ (round up)
  - Round toward $-\infty$ (round down)
  - Round toward 0 (truncation)

- In our tiny example:
  - Man = 1.001 01 rounded to M = 0b001
  - Man = 1.001 11 rounded to M = 0b010
  - Man = 1.001 10 rounded to M = 0b010

S	E	M
1	4	3

Floating Point Operations: Basic Idea

Value = $(-1)^{S} \times \text{Mantissa} \times 2^{\text{Exponent}}$

S	E	M

- $\texttt{x} +_{\texttt{f}} \texttt{y} = \texttt{Round(x + y)}$
- $\texttt{x} *_{\texttt{f}} \texttt{y} = \texttt{Round(x * y)}$
- Basic idea for floating point operations:
  - First, compute the exact result
  - Then *round* the result to make it fit into the specified precision (width of M)
    - Possibly over/underflow if exponent outside of range

Mathematical Properties of FP Operations

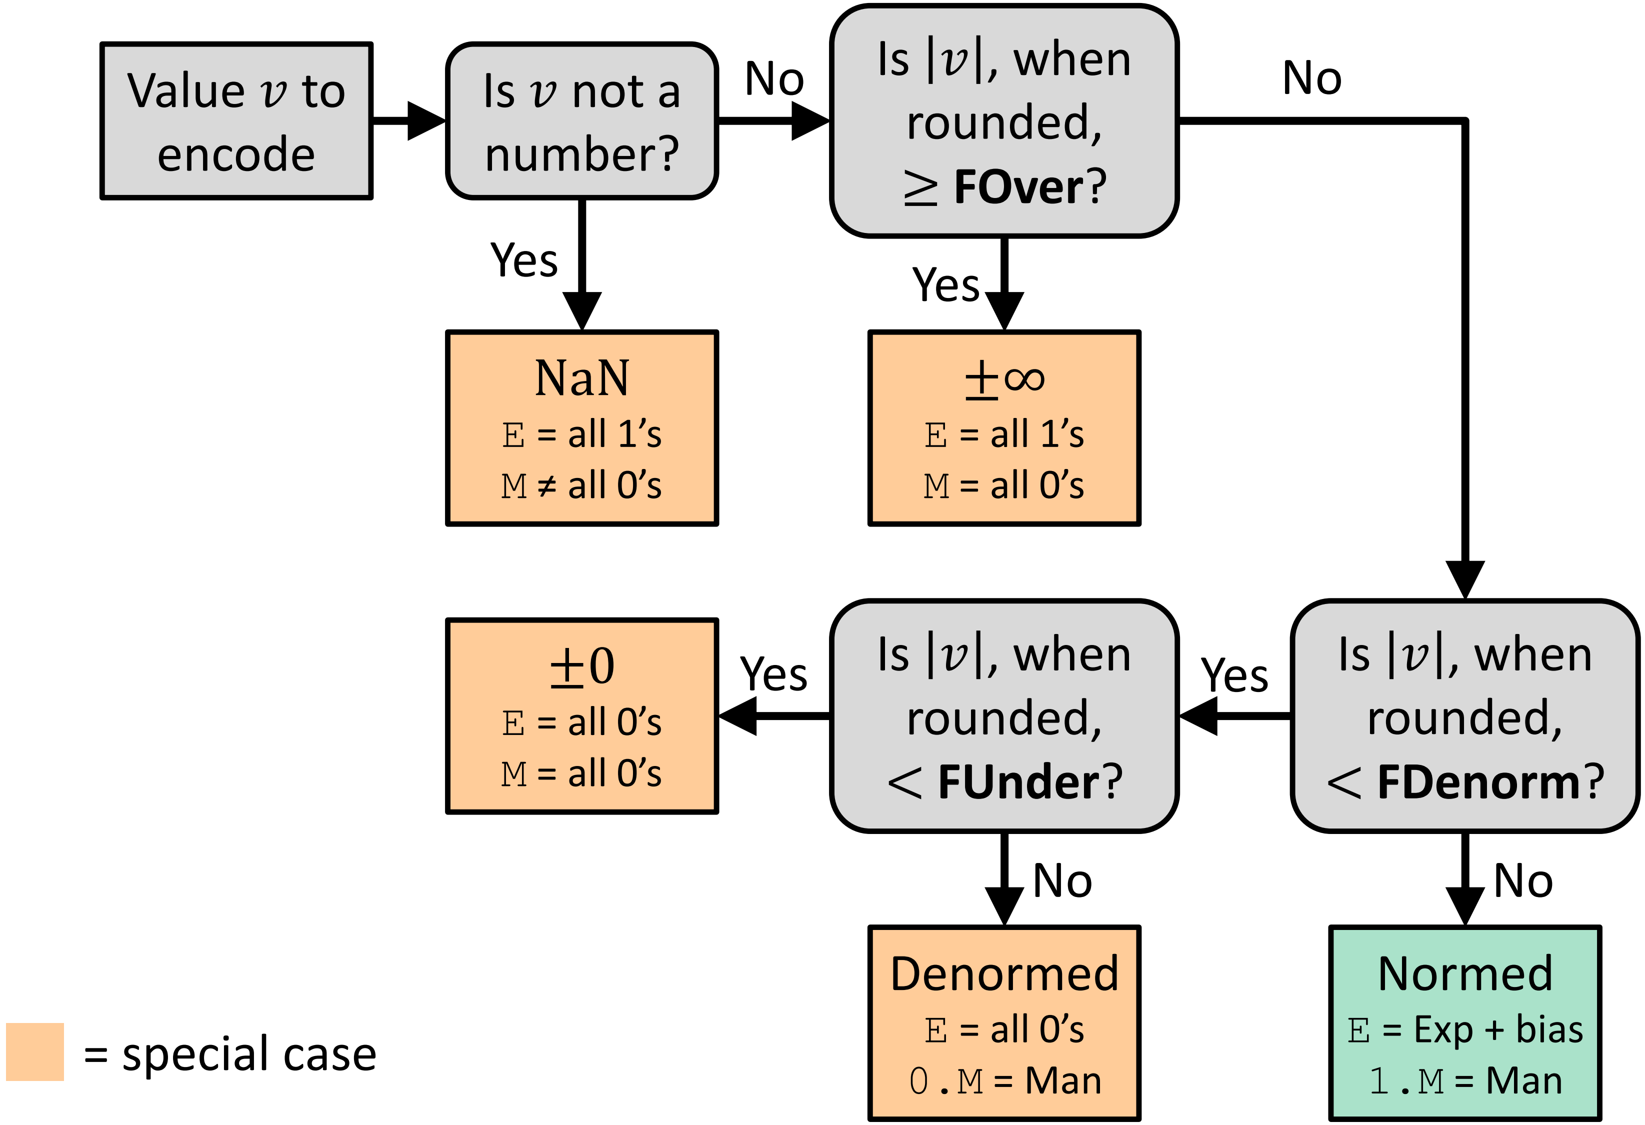
- Overflow yields $\pm\infty$ and underflow yields 0
- Floats with value $\pm\infty$ and NaN can be used in operations
  - Result usually still $\pm\infty$ or NaN, but not always intuitive
- Floating point operations do not work like real math, due to rounding
  - Not associative: `(3.14+1e100)–1e100 != 3.14+(1e100–1e100)`
    - **0** vs. **3.14**
  - Not distributive: `100*(0.1+0.2) != 100*0.1+100*0.2`
    - **30.000000000000003553** vs. **30**
  - Not cumulative
    - Repeatedly adding a very small number to a large one may do nothing

Aside: Limits of Interest

This is extra (non-testable) material

- The following thresholds will help give you a sense of when certain outcomes come into play, but don't worry about the specifics:
  - **FOver** = $2^{\text{bias}+1}$ = 2^8
    - This is just larger than the largest representable normalized number
  - **FDenorm** = $2^{1-\text{bias}}$ = 2^{-6}
    - This is the smallest representable normalized number
  - **FUnder** = $2^{1-\text{bias}-m}$ = 2^{-9}
    - m is the width of the mantissa field
    - This is the smallest representable denormalized number

Floating Point Encoding Flow Chart



Example Question [FP II - a]

- Using our **8-bit** representation, what value gets stored when we try to encode **384** = $2^8 + 2^7$?

S	E	M
1	4	3

  - No voting

A. **+ 256**

B. **+ 384**

C. **+ ∞**

D. **NaN**

E. **We're lost…**

Polling Question [FP II - b]

- Using our **8-bit** representation, what value gets stored when we try to encode **2.625** = $2^1 + 2^{-1} + 2^{-3}$?

S	E	M
1	4	3

  - Vote at http://pollev.com/rea

A. **+ 2.5**

B. **+ 2.625**

C. **+ 2.75**

D. **+ 3.25**

E. **We're lost…**

Floating point topics

- Fractional binary numbers
- IEEE floating-point standard
- Floating-point operations and rounding
- **Floating-point in C**

- There are many more details that we won't cover
  - It's a 58-page standard…

Floating Point in C

!!!

- Two common levels of precision:

`float`	`1.0f`	single precision (32-bit)
`double`	`1.0`	double precision (64-bit)

- `#include <math.h>` to get `INFINITY` and `NAN` constants

- Equality (==) comparisons between floating point numbers are tricky, and often return unexpected results, so just avoid them!

Floating Point Conversions in C

!!!

- Casting between `int`, `float`, and `double` **changes** the bit representation
  - `int` → `float`
    - May be rounded (not enough bits in mantissa: 23)
    - Overflow impossible
  - `int` or `float` → `double`
    - Exact conversion (all 32-bit `int`s representable)
  - `long` → `double`
    - Depends on word size (32-bit is exact, 64-bit may be rounded)
  - `double` or `float` → `int`
    - Truncates fractional part (rounded toward zero)
    - "Not defined" when out of range or NaN: generally sets to `Tmin` (even if the value is a very big positive)

Polling Question [FP II - c]

- We execute the following code in C. How many bytes are the same (value and position) between `i` and `f`?
  - Vote at http://pollev.com/rea

```
int i = 384;  // 2^8 + 2^7
float f = (float) i;
```

A. 0 bytes
B. 1 byte
C. 2 bytes
D. 3 bytes
E. We're lost…

Floating Point and the Programmer

```
#include <stdio.h>

int main(int argc, char* argv[]) {
  float f1 = 1.0;
  float f2 = 0.0;
  int i;
  for (i = 0; i < 10; i++)
    f2 += 1.0/10.0;

  printf("0x%08x  0x%08x\n", *(int*)&f1, *(int*)&f2);
  printf("f1 = %10.9f\n", f1);
  printf("f2 = %10.9f\n\n", f2);

  f1 = 1E30;
  f2 = 1E-30;
  float f3 = f1 + f2;
  printf("f1 == f3? %s\n", f1 == f3 ? "yes" : "no" );

  return 0;
}
```

```
$ ./a.out
0x3f800000  0x3f800001
f1 = 1.000000000
f2 = 1.000000119

f1 == f3? yes
```

Floating Point Summary

- Floats also suffer from the fixed number of bits available to represent them
  - Can get overflow/underflow
  - "Gaps" produced in representable numbers means we can lose precision, unlike `int`s
    - Some "simple fractions" have no exact representation (*e.g.* 0.2)
    - "Every operation gets a slightly wrong result"
- Floating point arithmetic not associative or distributive
  - Mathematically equivalent ways of writing an expression may compute different results
- Never test floating point values for equality!
- Careful when converting between `int`s and `float`s!

Number Representation Really Matters

- **1991:** Patriot missile targeting error
  - clock skew due to conversion from integer to floating point
- **1996:** Ariane 5 rocket exploded ($1 billion)
  - overflow converting 64-bit floating point to 16-bit integer
- **2000:** Y2K problem
  - limited (decimal) representation: overflow, wrap-around
- **2038:** Unix epoch rollover
  - Unix epoch = seconds since 12am, January 1, 1970
  - signed 32-bit integer representation rolls over to TMin in 2038
- **Other related bugs:**
  - 1982: Vancouver Stock Exchange 10% error in less than 2 years
  - 1994: Intel Pentium FDIV (floating point division) HW bug ($475 million)
  - 1997: USS Yorktown "smart" warship stranded: divide by zero
  - 1998: Mars Climate Orbiter crashed: unit mismatch ($193 million)

Summary

E	M	Meaning
0x00	0	± 0
0x00	non-zero	± denorm num
0x01 – 0xFE	anything	± norm num
0xFF	0	± ∞
0xFF	non-zero	NaN

- Floating point encoding has many limitations
  - Overflow, underflow, rounding
  - Rounding is a HUGE issue due to limited mantissa bits and gaps that are scaled by the value of the exponent
  - Floating point arithmetic is NOT associative or distributive
- Converting between integral and floating point data types *does* change the bits
