# CSE 351 Section 2 – Pointers and Bit Operators

## Pointers

A pointer is a variable that holds an address. C uses pointers explicitly. If we have a variable x, then &x gives the address of x rather than the value of x. If we have a pointer p, then \*p gives us the value that p points to, rather than the value of p.

Consider the following declarations and assignments:

```
int x;
int *ptr;
ptr = &x;
```

- We can represent the result of these three lines of code visually as shown. The variable ptr stores the address of x, and we say "ptr points to x." x currently doesn't contain a value since we did not assign x a value!
- 2) After executing x = 5; the memory diagram changes as shown.
- 3) After executing \*ptr = 200;, the memory diagram changes as shown. We modified the value of x by dereferencing ptr.

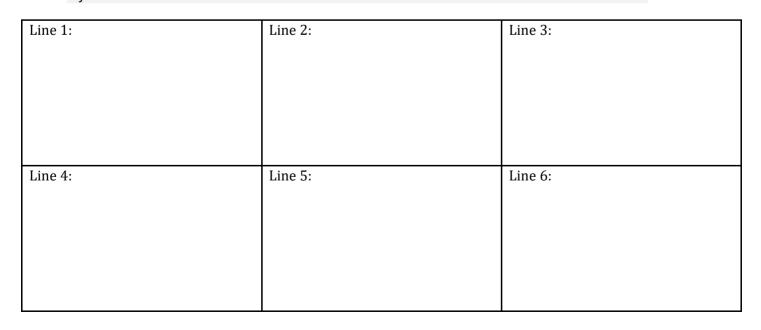

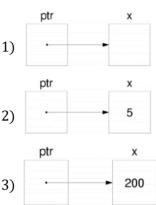

In C, arithmetic on pointers (++, +, -, -) is scaled by the size of the data type the pointer points to. That is, if p is declared with pointer **type\*** p, then p + i will change the value of p (an address) by i\*sizeof(**type**) (in bytes). If there is a line \*p = \*p + 1, regular arithmetic will apply unless \*p is also a pointer datatype.

### Exercise:

Draw out the memory diagram after sequential execution of each of the lines below:

```
int main(int argc, char **argv) {
    int x = 410, y = 350; // assume &x = 0x10, &y = 0x14
    int *p = &x; // p is a pointer to an integer
    *p = y;
    p = p + 4;
    p = &y;
    x = *p + 1;
}
```

#### **C** Bitwise Operators

&	0	1	$\leftarrow$	<b>AND</b> ( $\&$ ) outputs a 1 only when both input bits are 1.			0	1
0	0	0	-		-	0	0	1
1	0	1		<b>OR</b> ( ) outputs a 1 when either input bit is 1.	$\rightarrow$	1	1	1
	8							
^	0	1	←	<b>XOR</b> (^) outputs a 1 when either input is <i>exclusively</i> 1.		~		
0	0	1	-		-	0	1	
1	1	0		<b>NOT</b> (~) outputs the opposite of its input.	$\rightarrow$	1	0	

*Masking* is very commonly used with bitwise operations. A mask is a binary constant used to manipulate another bit string in a specific manner, such as setting specific bits to 1 or 0.

#### Exercises:

1) What happens when we fix/set one of the inputs to the 2-input gates? Let x be the other input. Fill in the following blanks with either 0, 1, x, or  $\bar{x}$  (NOT x):

x & 0 =	x   0 =	x ^ 0 = _	
x & 1 =	x   1 =	x ^ 1 =	

2) Lab 1 Helper Exercises: Lab 1 is intended to familiarize you with bitwise operations in C through a series of puzzles. These exercises are either sub-problems directly from the lab or expose concepts needed to complete the lab. Start early!

```
Bit Extraction: Returns the value (0 or 1) of the 19<sup>th</sup> bit (counting from LSB). Allowed operators: >>, &, |, ~.
   int extract19(int x) {
      return
   }
Subtraction: Returns the value of x-y. Allowed operators: >>, &, |, ~, +.
   int subtract(int x, int y) {
      return _____;
   }
Equality: Returns the value of x = y. Allowed operators: >>, &, |, ~, +, ^, !.
   int equals(int x, int y) {
      return _____;
Divisible by Eight? Returns the value of (x\%8) = =0. Allowed operators: >>, <<, &, |, ~, +, ^, !.
   int divisible by 8(int x) {
      return _____;
Greater than Zero? Returns the value of x>0. Allowed operators: >>, \&, |, \sim, +, ^, !.
   int greater than 0(int x) {
      return _____
```
