

# CSE 351 Section 2 – Pointers and Bit Operators

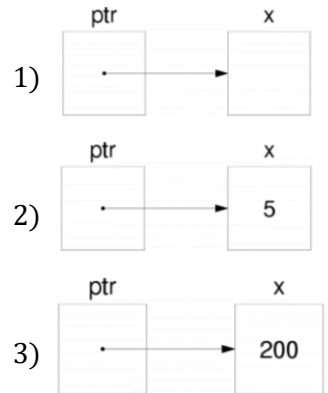

## Pointers

A pointer is a variable that holds an address. C uses pointers explicitly. If we have a variable `x`, then `&x` gives the address of `x` rather than the value of `x`. If we have a pointer `p`, then `*p` gives us the value that `p` points to, rather than the value of `p`.

Consider the following declarations and assignments:

```
int x;
int *ptr;
ptr = &x;
```

- 1) We can represent the result of these three lines of code visually as shown. The variable `ptr` stores the address of `x`, and we say “`ptr` points to `x`.” `x` currently doesn’t contain a value since we did not assign `x` a value!
- 2) After executing `x = 5;`, the memory diagram changes as shown.
- 3) After executing `*ptr = 200;`, the memory diagram changes as shown. We modified the value of `x` by dereferencing `ptr`.

## Pointer Arithmetic

In C, arithmetic on pointers (`++`, `+`, `--`, `-`) is scaled by the size of the data type the pointer points to. That is, if `p` is declared with pointer `type*` `p`, then `p + i` will change the value of `p` (an address) by `i * sizeof(type)` (in bytes). If there is a line `*p = *p + 1`, regular arithmetic will apply unless `*p` is also a pointer datatype.

### Exercise:

Draw out the memory diagram after sequential execution of each of the lines below:

```
int main(int argc, char **argv) {
    int x = 410, y = 350; // assume &x = 0x10, &y = 0x14
    int *p = &x; // p is a pointer to an integer
    *p = y;
    p = p + 4;
    p = &y;
    x = *p + 1;
}
```

Line 1:	<table border="0"> <tr><td>x</td></tr> <tr><td>410</td></tr> <tr><td>y</td></tr> <tr><td>350</td></tr> </table>	x	410	y	350	Line 2:	<table border="0"> <tr><td>p</td><td>x</td></tr> <tr><td>0x10</td><td>410</td></tr> <tr><td>→</td><td></td></tr> <tr><td></td><td>y</td></tr> <tr><td></td><td>350</td></tr> </table>	p	x	0x10	410	→			y		350	Line 3:	<table border="0"> <tr><td>p</td><td>x</td></tr> <tr><td>0x10</td><td>350</td></tr> <tr><td>→</td><td></td></tr> <tr><td></td><td>y</td></tr> <tr><td></td><td>350</td></tr> </table>	p	x	0x10	350	→			y		350

## C Bitwise Operators

<b>&amp;</b>	0	1
0	0	0
1	0	1

 ← **AND (&)** outputs a 1 only when both input bits are 1.

<b> </b>	0	1
0	0	1
1	1	1

 → **OR (|)** outputs a 1 when either input bit is 1.

<b>^</b>	0	1
0	0	1
1	1	0

 ← **XOR (^)** outputs a 1 when either input is *exclusively* 1.

<b>~</b>	
0	1
1	0

 → **NOT (~)** outputs the opposite of its input.

*Masking* is very commonly used with bitwise operations. A mask is a binary constant used to manipulate another bit string in a specific manner, such as setting specific bits to 1 or 0.

### Exercises:

- 1) What happens when we fix/set one of the inputs to the 2-input gates? Let  $x$  be the other input. Fill in the following blanks with either 0, 1,  $x$ , or  $\bar{x}$  (NOT  $x$ ):

$x \& 0 = \underline{0}$	$x   0 = \underline{x}$	$x \wedge 0 = \underline{x}$
$x \& 1 = \underline{x}$	$x   1 = \underline{1}$	$x \wedge 1 = \underline{\bar{x}}$

- 2) **Lab 1 Helper Exercises:** Lab 1 is intended to familiarize you with bitwise operations in C through a series of puzzles. These exercises are either sub-problems directly from the lab or expose concepts needed to complete the lab. Start early!

**Bit Extraction:** Returns the value (0 or 1) of the 19<sup>th</sup> bit (counting from LSB). Allowed operators:  $\gg$ ,  $\&$ ,  $|$ ,  $\sim$ .

```
int extract19(int x) {
    return (x >> 18) & 0x1;
}
```

**Subtraction:** Returns the value of  $x-y$ . Allowed operators:  $\gg$ ,  $\&$ ,  $|$ ,  $\sim$ ,  $+$ .

```
int subtract(int x, int y) {
    return x + ((~y) + 1);
}
```

**Equality:** Returns the value of  $x==y$ . Allowed operators:  $\gg$ ,  $\&$ ,  $|$ ,  $\sim$ ,  $+$ ,  $\wedge$ ,  $!$ .

```
int equals(int x, int y) {
    return !(x ^ y);
}
```

**Divisible by Eight?** Returns the value of  $(x\%8)==0$ . Allowed operators:  $\gg$ ,  $\ll$ ,  $\&$ ,  $|$ ,  $\sim$ ,  $+$ ,  $\wedge$ ,  $!$ .

```
int divisible_by_8(int x) {
    return !(x << 29);
}
```

**Greater than Zero?** Returns the value of  $x>0$ . Allowed operators:  $\gg$ ,  $\&$ ,  $|$ ,  $\sim$ ,  $+$ ,  $\wedge$ ,  $!$ .

```
int greater_than_0(int x) {
    /* invert and check sign; we need the third operand for the T_min case */
    return ((~x + 1) >> 31) & 0x1 & ~(x >> 31) _OR_ !!x & ~(x >> 31);
}
```
