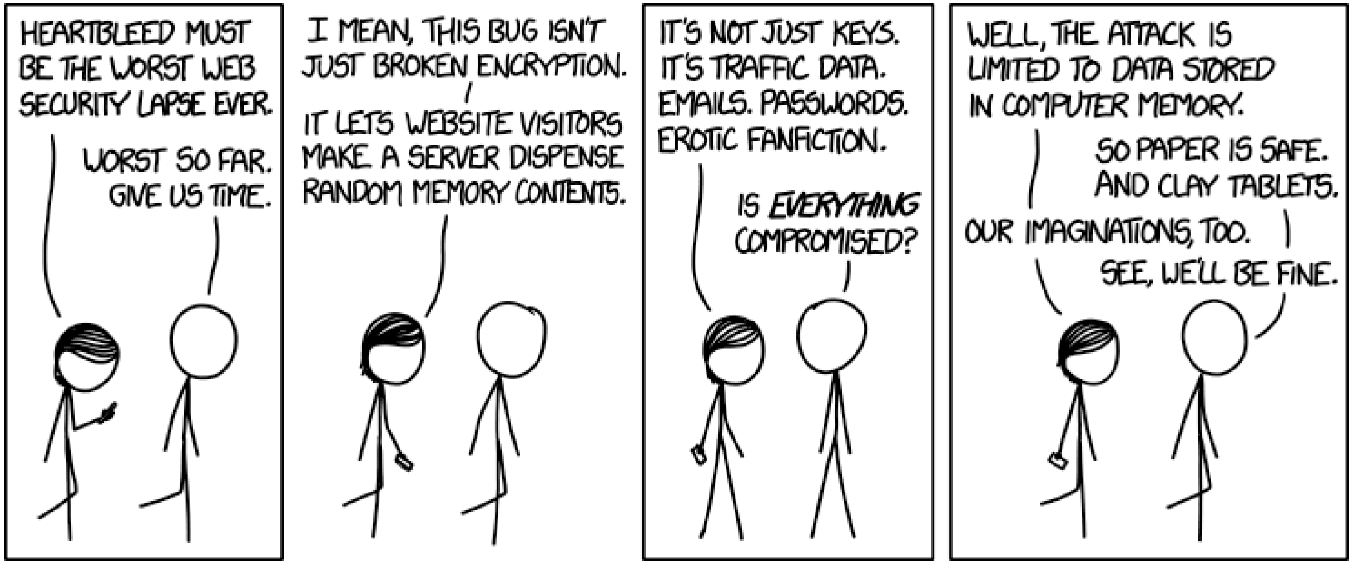
Eddy (Tianyi) Zhou



HEARTBLEED MUST BE THE WORST WEB SECURITY LAPSE EVER.
WORST SO FAR. GIVE US TIME.
I MEAN, THIS BUG ISN'T JUST BROKEN ENCRYPTION.
IT LETS WEBSITE VISITORS MAKE A SERVER DISPENSE RANDOM MEMORY CONTENTS.
IT'S NOT JUST KEYS. IT'S TRAFFIC DATA. EMAILS. PASSWORDS. EROTIC FANFICTION.
IS EVERYTHING COMPROMISED?
WELL, THE ATTACK IS LIMITED TO DATA STORED IN COMPUTER MEMORY.
SO PAPER IS SAFE. AND CLAY TABLETS.
OUR IMAGINATIONS, TOO.
SEE, WE'LL BE FINE.

Alt text: I looked at some of the data dumps from vulnerable sites, and it was ... bad. I saw emails, passwords, password hints. SSL keys and session cookies. Important servers brimming with visitor IPs. Attack ships on fire off the shoulder of Orion, c-beams glittering in the dark near the Tannhäuser Gate. I should probably patch OpenSSL.

http://xkcd.com/1353/

Administrivia

- hw14 due Wednesday (2/19)
- Video to watch! Due Wed 2/19
  - Goal: shift lecture schedule slightly to give you more time for Lab5 (an extra weekend!)
  - 1-2 videos will be posted to stand in for lecture we are missing on Monday – watch before lecture on Wed 2/19
- Lab 3 due next Monday (2/24)
- Midterm grades coming soon
  - Solutions posted on website soon
  - Graded exam will be found on Gradescope
  - Regrade requests will be open for a short time after grade release

Roadmap

C:

```
car *c = malloc(sizeof(car));
c->miles = 100;
c->gals = 17;
float mpg = get_mpg(c);
free(c);
```

Java:

```
Car c = new Car();
c.setMiles(100);
c.setGals(17);
float mpg =
    c.getMPG();
```

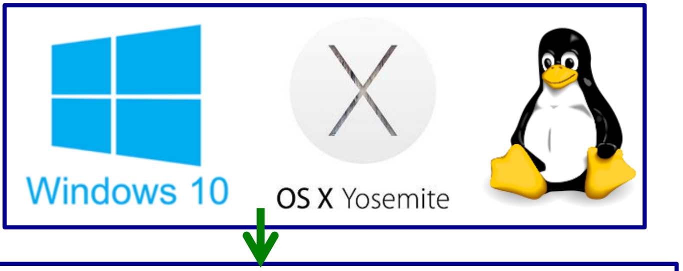
Assembly language:

```
get_mpg:
    pushq   %rbp
    movq    %rsp, %rbp
    ...
    popq    %rbp
    ret
```

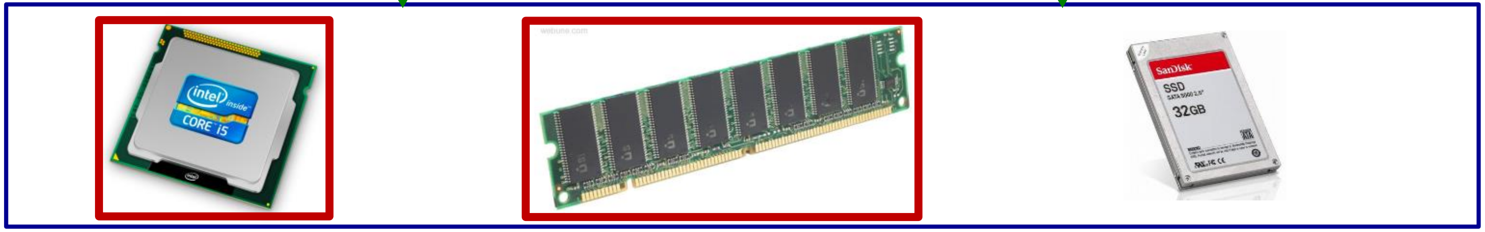
Machine code:

```
0111010000011000
100011010000010000000010
1000100111000010
110000011111101000011111
```

OS:



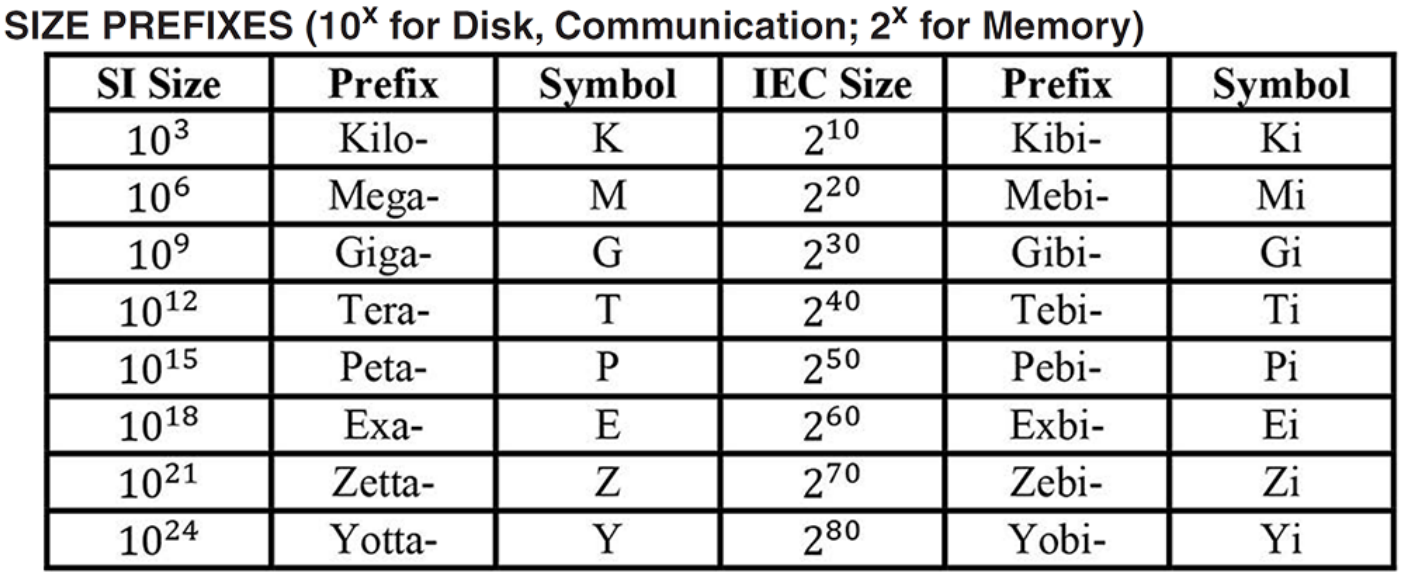
Computer system:



- Memory & data
- Integers & floats
- x86 assembly
- Procedures & stacks
- Executables
- Arrays & structs
- Memory & caches
- Processes
- Virtual memory
- Memory allocation
- Java vs. C

Aside: Units and Prefixes

- Here focusing on large numbers (exponents > 0)
- Note that $10^3 \approx 2^{10}$
- SI prefixes are *ambiguous* if base 10 or 2
- IEC prefixes are *unambiguously* base 2



SIZE PREFIXES (10^x for Disk, Communication; 2^x for Memory)

SI Size	Prefix	Symbol	IEC Size	Prefix	Symbol
10^3	Kilo-	K	2^{10}	Kibi-	Ki
10^6	Mega-	M	2^{20}	Mebi-	Mi
10^9	Giga-	G	2^{30}	Gibi-	Gi
10^{12}	Tera-	T	2^{40}	Tebi-	Ti
10^{15}	Peta-	P	2^{50}	Pebi-	Pi
10^{18}	Exa-	E	2^{60}	Exbi-	Ei
10^{21}	Zetta-	Z	2^{70}	Zebi-	Zi
10^{24}	Yotta-	Y	2^{80}	Yobi-	Yi

How to Remember?

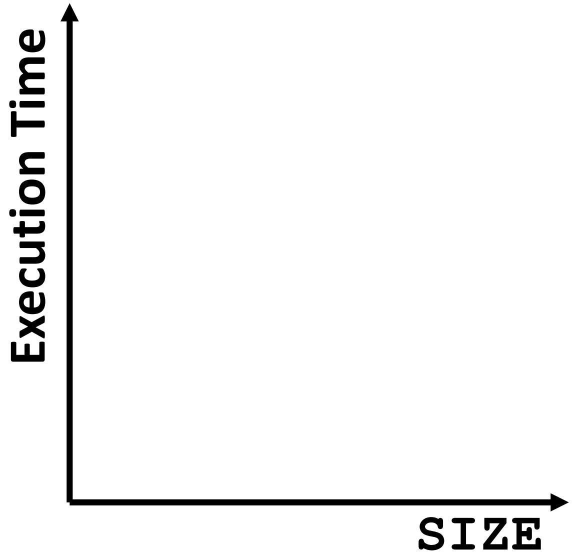
- Will be given to you on Final reference sheet
- Mnemonics
  - There unfortunately isn't one well-accepted mnemonic
    - But that shouldn't stop you from trying to come with one!
  - **K**iller **M**echanical **G**iraffe **T**eaches **P**et, **E**xtinct **Z**ebra to **Y**odel
  - **K**irby **M**issed **G**anondorf **T**erribly, **P**otentially **E**xterminating **Z**elda and **Y**oshi
  - xkcd: **K**arl **M**arx **G**ave **T**he **P**roletariat **E**leven **Z**eppelins, **Y**o
    - https://xkcd.com/992/
  - Post your best on Piazza!

How does execution time grow with SIZE?

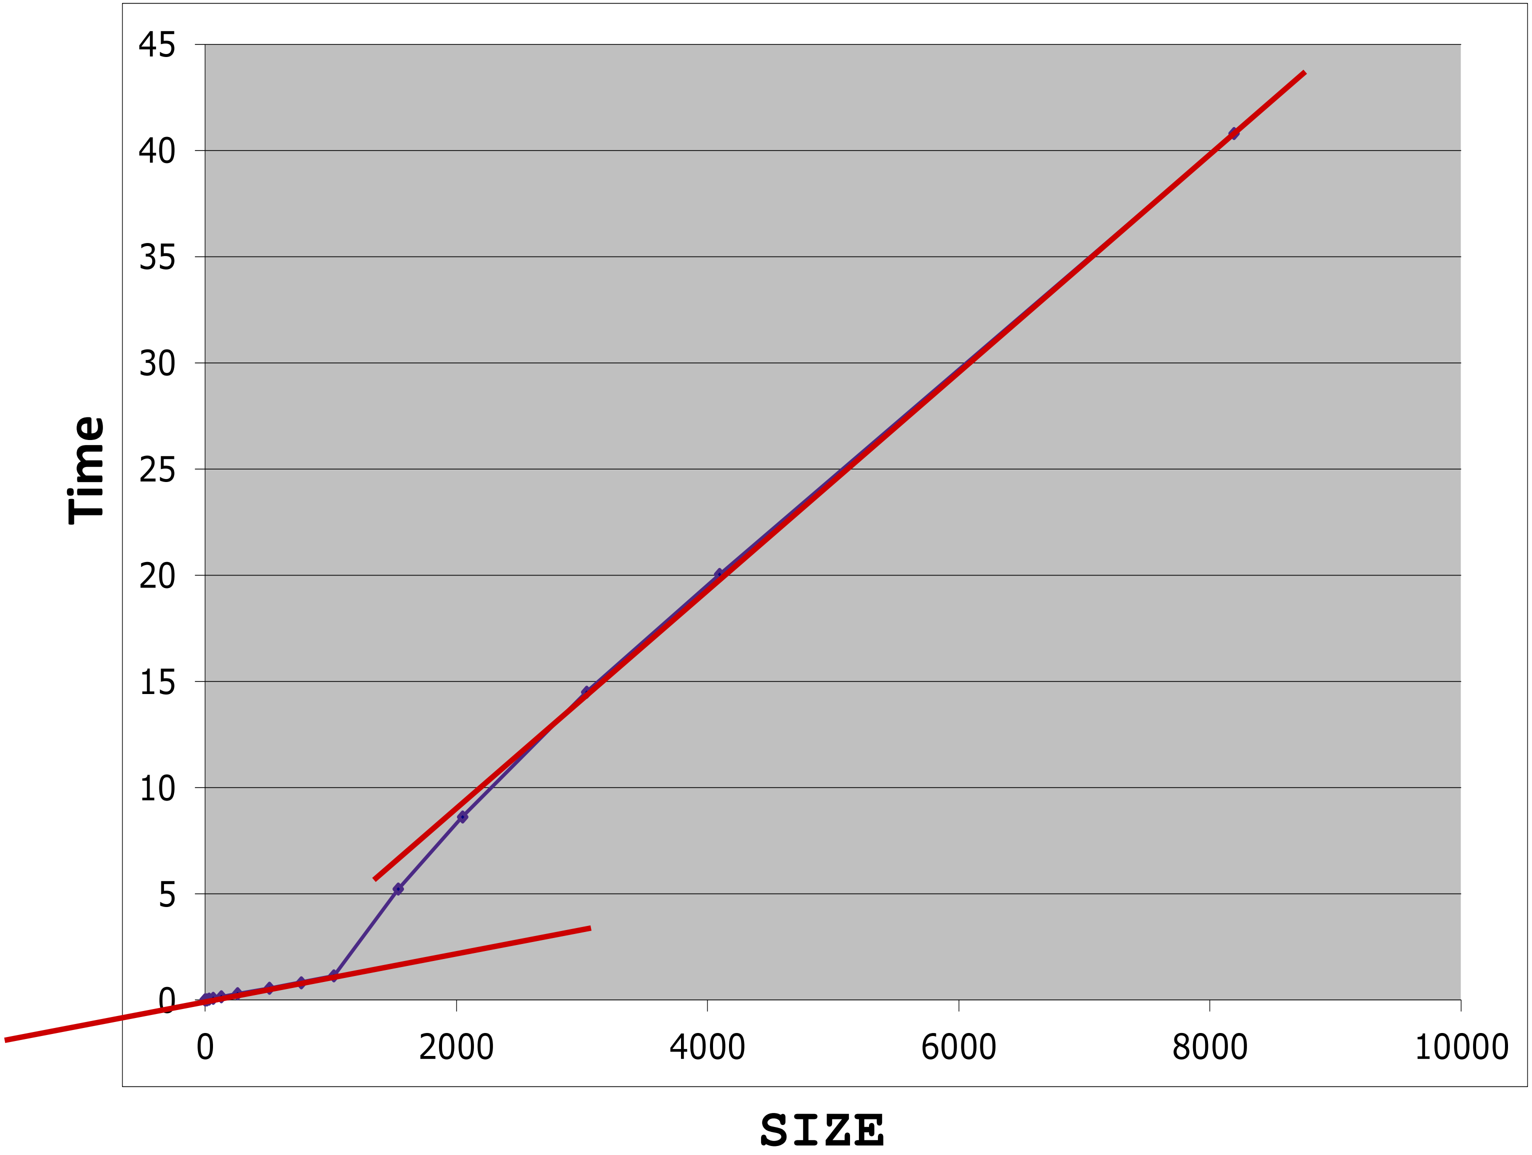
```
int array[SIZE];
int sum = 0;

for (int i = 0; i < 200000; i++) {
  for (int j = 0; j < SIZE; j++) {
    sum += array[j];
  }
}
```

Plot:



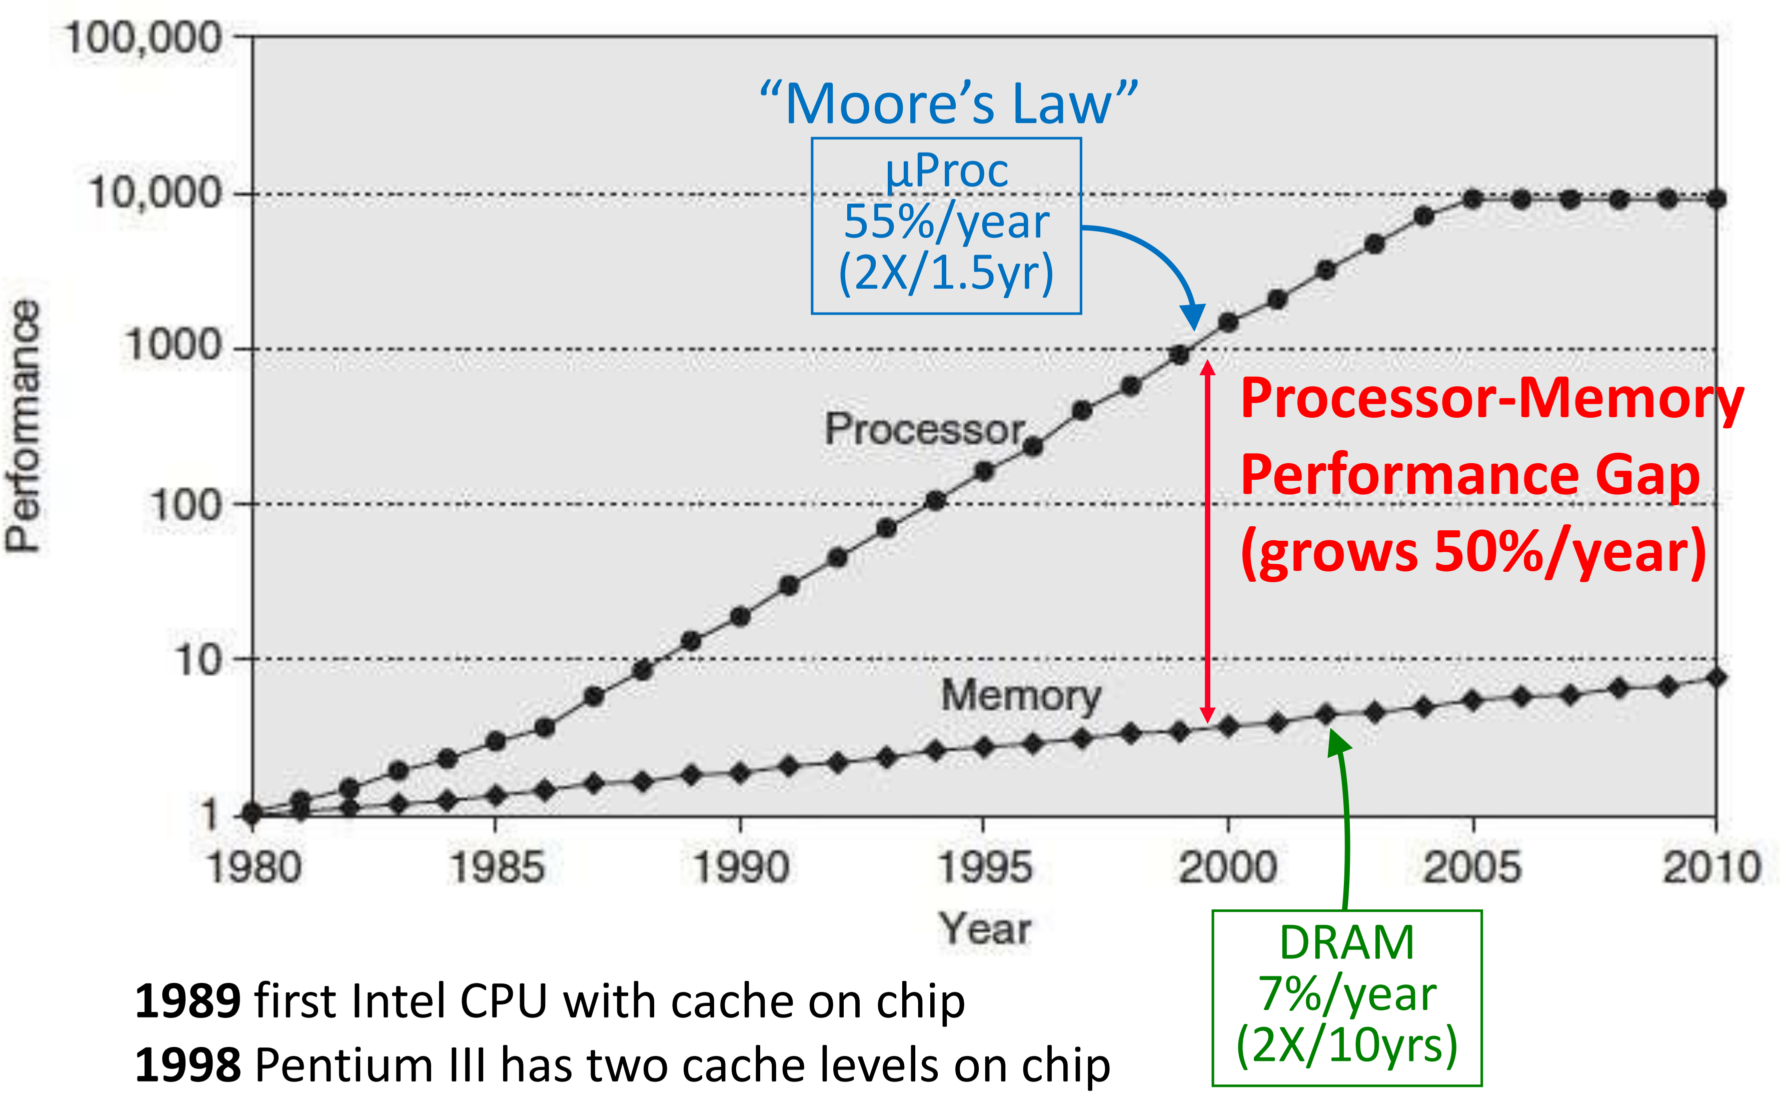
Actual Data



Making memory accesses fast!

- **Cache basics**
- **Principle of locality**
- **Memory hierarchies**
- Cache organization
- Program optimizations that consider caches

Processor-Memory Gap



“Moore’s Law”

µProc
55%/year
(2X/1.5yr)

Processor-Memory Performance Gap (grows 50%/year)

DRAM
7%/year
(2X/10yrs)

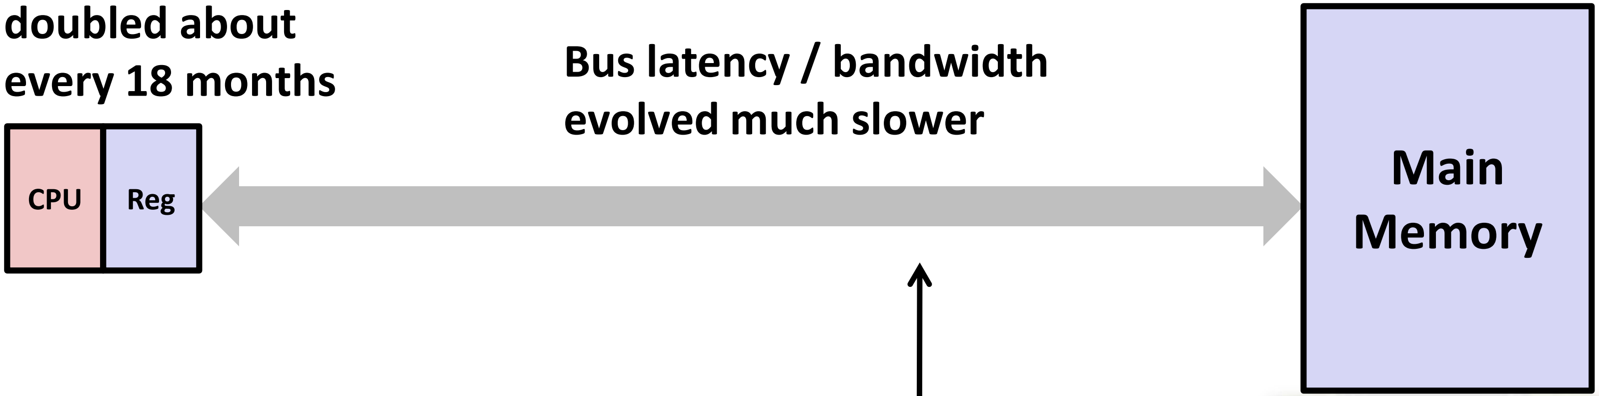
1989 first Intel CPU with cache on chip

1998 Pentium III has two cache levels on chip

Problem: Processor-Memory Bottleneck

Processor performance doubled about every 18 months

Bus latency / bandwidth evolved much slower



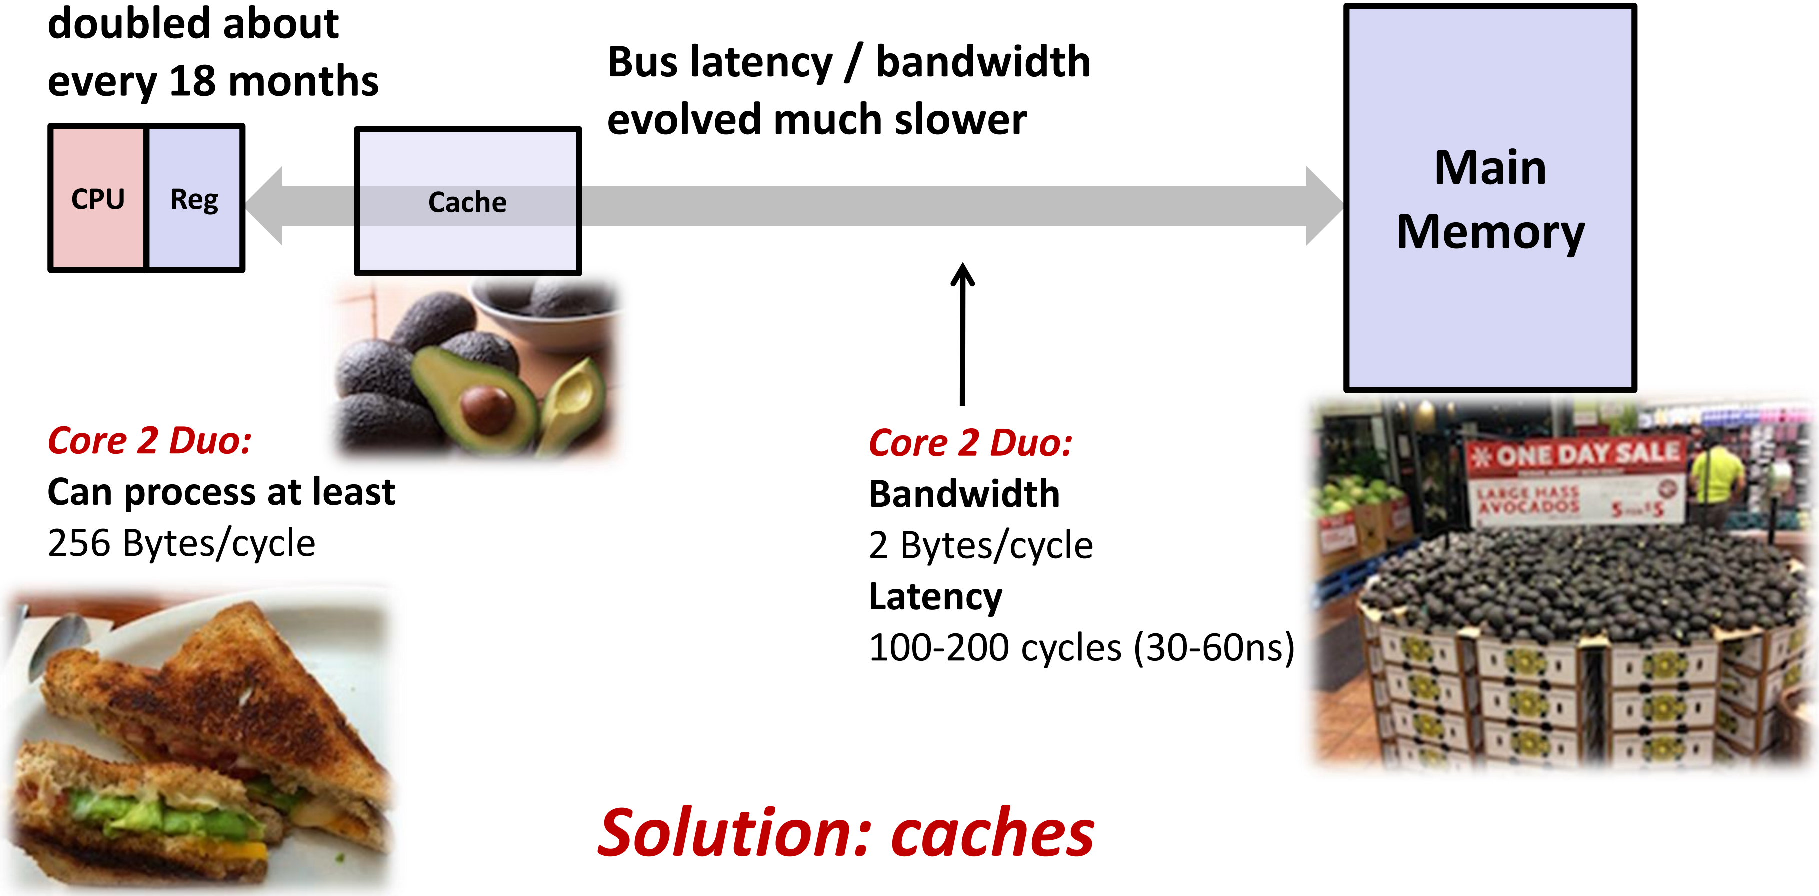
Core 2 Duo:
Can process at least
256 Bytes/cycle

Core 2 Duo:
Bandwidth
2 Bytes/cycle
Latency
100-200 cycles (30-60ns)

Problem: lots of waiting on memory

***cycle**: single machine step (fixed-time)*

Problem: Processor-Memory Bottleneck



Processor performance doubled about every 18 months

Bus latency / bandwidth evolved much slower

Core 2 Duo:
Can process at least
256 Bytes/cycle

Core 2 Duo:
Bandwidth
2 Bytes/cycle
Latency
100-200 cycles (30-60ns)

Solution: caches

***cycle**: single machine step (fixed-time)*

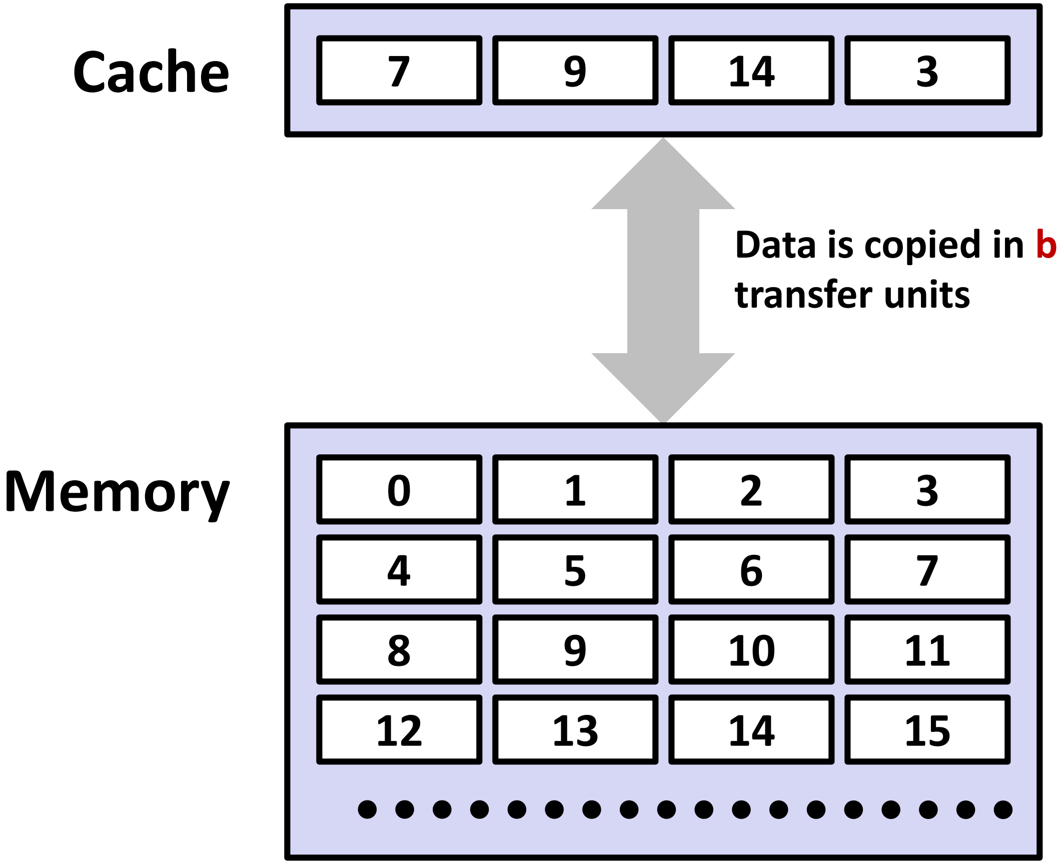
Cache 💰

- Pronunciation: "cash"
  - We abbreviate this as "$"

- English: A hidden storage space
  for provisions, weapons, and/or treasures

- Computer: Memory with short access time used for the storage of frequently or recently used instructions (i-cache/I$) or data (d-cache/D$)
  - *More generally:* Used to optimize data transfers between any system elements with different characteristics (network interface cache, I/O cache, etc.)

General Cache Mechanics



Cache

7	9	14	3

- Smaller, faster, more expensive memory
- Caches a subset of the blocks

Data is copied in block-sized transfer units

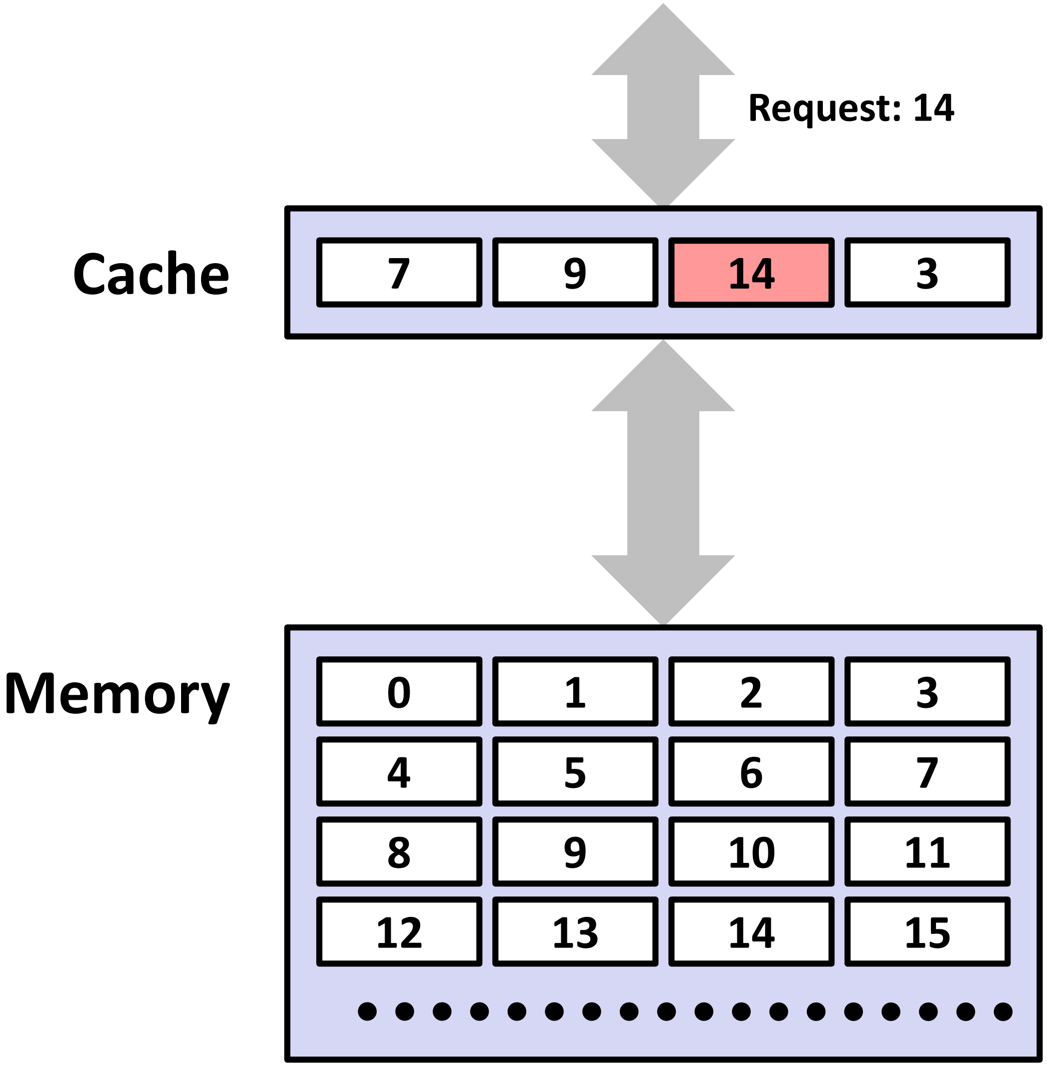
Memory

0	1	2	3
4	5	6	7
8	9	10	11
12	13	14	15

● ● ● ● ● ● ● ● ● ● ● ● ● ● ● ● ● ●

- Larger, slower, cheaper memory.
- Viewed as partitioned into “blocks”

General Cache Concepts: Hit

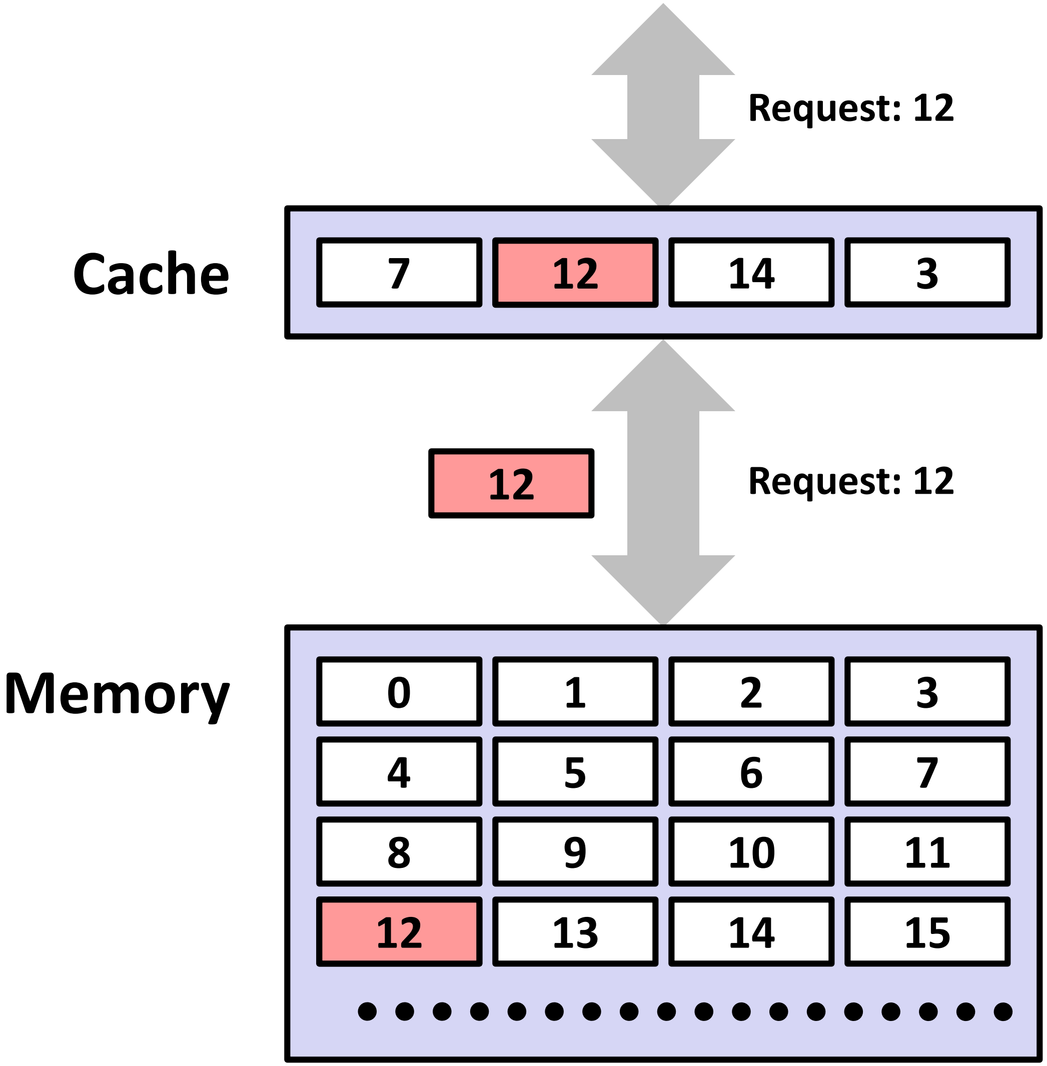


Data in block b is needed

Block b is in cache:
Hit!

Data is returned to CPU

General Cache Concepts: Miss



Data in block b is needed

Block b is not in cache:
Miss!

Block b is fetched from memory

Block b is stored in cache

- Placement policy: determines where b goes
- Replacement policy: determines which block gets evicted (victim)

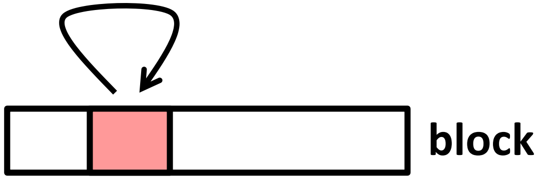
Data is returned to CPU

Why Caches Work

- Locality: Programs tend to use data and instructions with addresses near or equal to those they have used recently

Why Caches Work

- Locality: Programs tend to use data and instructions with addresses near or equal to those they have used recently

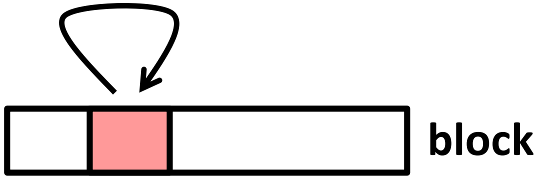


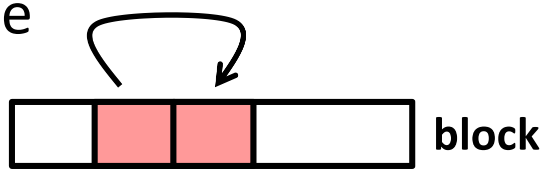
- *Temporal* locality:
  - Recently referenced items are *likely* to be referenced again in the near future

Why Caches Work

- Locality: Programs tend to use data and instructions with addresses near or equal to those they have used recently

- *Temporal* locality:
  - Recently referenced items are *likely* to be referenced again in the near future





- *Spatial* locality:
  - Items with nearby addresses *tend* to be referenced close together in time

- How do caches take advantage of this?

Example: Any Locality?

```
sum = 0;
for (i = 0; i < n; i++)
{
  sum += a[i];
}
return sum;
```

- **Data:**
  - Temporal: `sum` referenced in each iteration
  - Spatial: consecutive elements of array `a[]` accessed
- **Instructions:**
  - Temporal: cycle through loop repeatedly
  - Spatial: reference instructions in sequence

Locality Example #1

```
int sum_array_rows(int a[M][N])
{
    int i, j, sum = 0;

    for (i = 0; i < M; i++)
        for (j = 0; j < N; j++)
            sum += a[i][j];

    return sum;
}
```

Locality Example #1

```
int sum_array_rows(int a[M][N])
{
    int i, j, sum = 0;

    for (i = 0; i < M; i++)
        for (j = 0; j < N; j++)
            sum += a[i][j];

    return sum;
}
```

M = 3, N=4

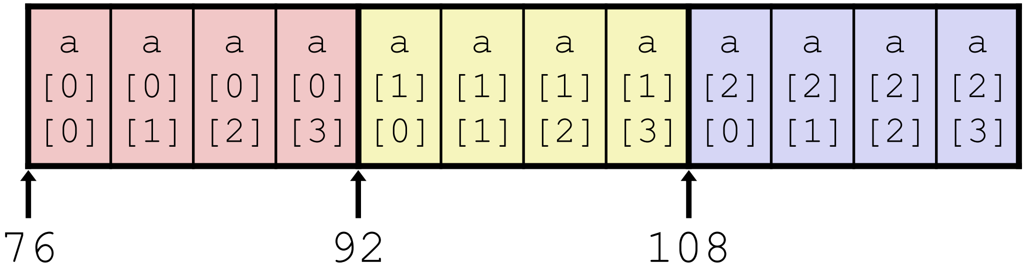
a[0][0]	a[0][1]	a[0][2]	a[0][3]
a[1][0]	a[1][1]	a[1][2]	a[1][3]
a[2][0]	a[2][1]	a[2][2]	a[2][3]

Access Pattern:

stride = ?

1) a[0][0]
2) a[0][1]
3) a[0][2]
4) a[0][3]
5) a[1][0]
6) a[1][1]
7) a[1][2]
8) a[1][3]
9) a[2][0]
10) a[2][1]
11) a[2][2]
12) a[2][3]

Layout in Memory



a[0][0]	a[0][1]	a[0][2]	a[0][3]	a[1][0]	a[1][1]	a[1][2]	a[1][3]	a[2][0]	a[2][1]	a[2][2]	a[2][3]

Note: 76 is just one possible starting address of array a

Locality Example #2

```
int sum_array_cols(int a[M][N])
{
    int i, j, sum = 0;

    for (j = 0; j < N; j++)
        for (i = 0; i < M; i++)
            sum += a[i][j];

    return sum;
}
```

Locality Example #2

```
int sum_array_cols(int a[M][N])
{
    int i, j, sum = 0;

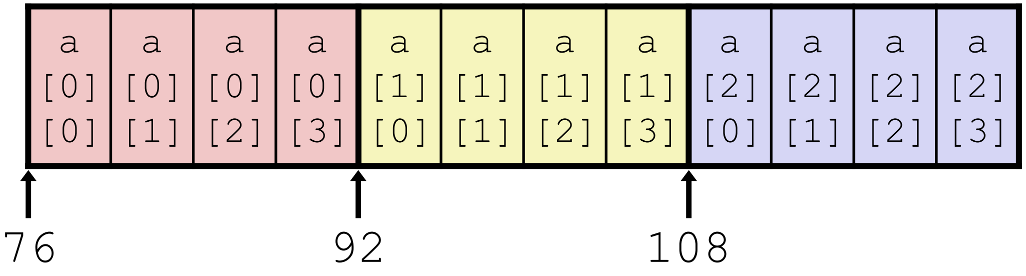
    for (j = 0; j < N; j++)
        for (i = 0; i < M; i++)
            sum += a[i][j];

    return sum;
}
```

M = 3, N=4

a[0][0]	a[0][1]	a[0][2]	a[0][3]
a[1][0]	a[1][1]	a[1][2]	a[1][3]
a[2][0]	a[2][1]	a[2][2]	a[2][3]

Layout in Memory



a[0][0]	a[0][1]	a[0][2]	a[0][3]	a[1][0]	a[1][1]	a[1][2]	a[1][3]	a[2][0]	a[2][1]	a[2][2]	a[2][3]

Access Pattern:

stride = ?

1) a[0][0]
2) a[1][0]
3) a[2][0]
4) a[0][1]
5) a[1][1]
6) a[2][1]
7) a[0][2]
8) a[1][2]
9) a[2][2]
10) a[0][3]
11) a[1][3]
12) a[2][3]

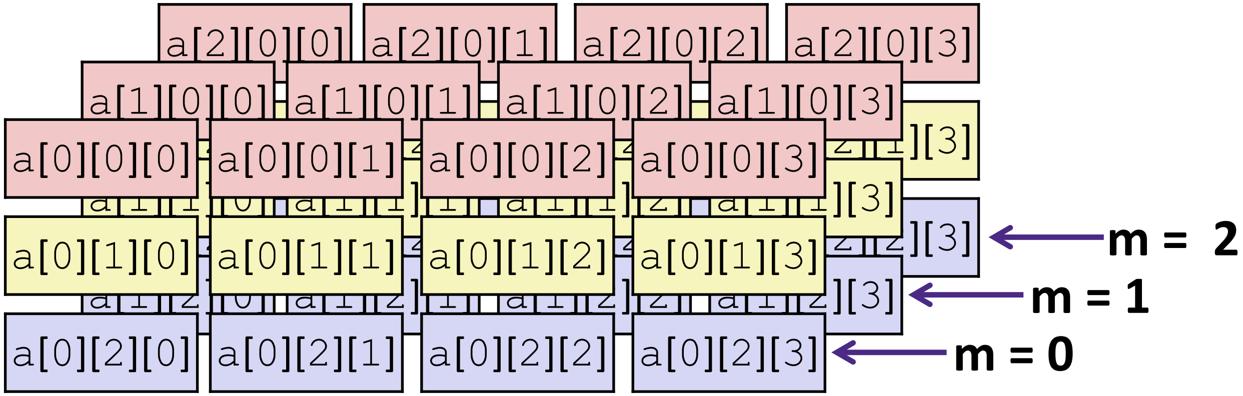
Locality Example #3

```
int sum_array_3D(int a[M][N][L])
{
    int i, j, k, sum = 0;

    for (i = 0; i < N; i++)
        for (j = 0; j < L; j++)
            for (k = 0; k < M; k++)
                sum += a[k][i][j];

    return sum;
}
```

- What is wrong with this code?
- How can it be fixed?



Locality Example #3

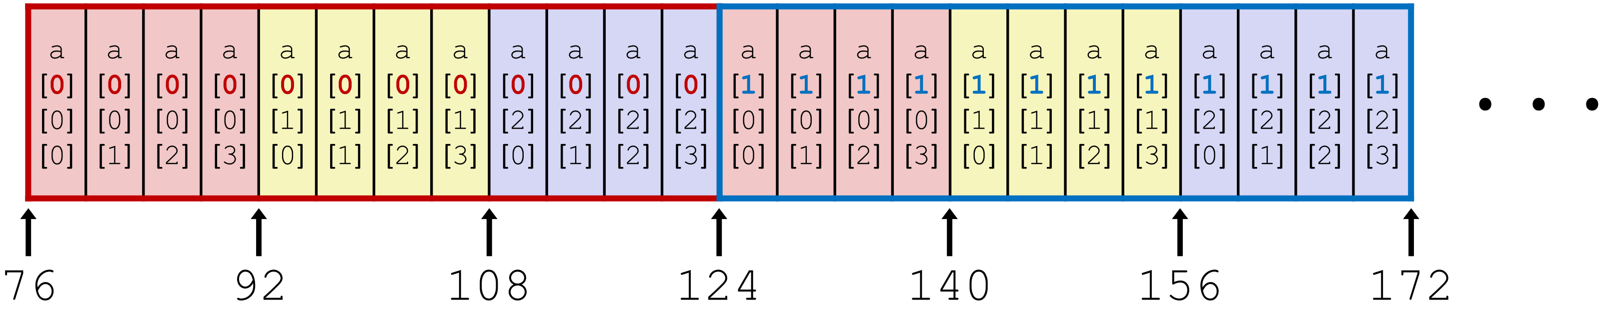
```
int sum_array_3D(int a[M][N][L])
{
    int i, j, k, sum = 0;

    for (i = 0; i < N; i++)
        for (j = 0; j < L; j++)
            for (k = 0; k < M; k++)
                sum += a[k][i][j];

    return sum;
}
```

- What is wrong with this code?
- How can it be fixed?

Layout in Memory (M = ?, N = 3, L = 4)



a[0][0][0] a[0][0][1] a[0][0][2] a[0][0][3] a[0][1][0] a[0][1][1] a[0][1][2] a[0][1][3] a[0][2][0] a[0][2][1] a[0][2][2] a[0][2][3] a[1][0][0] a[1][0][1] a[1][0][2] a[1][0][3] a[1][1][0] a[1][1][1] a[1][1][2] a[1][1][3] a[1][2][0] a[1][2][1] a[1][2][2] a[1][2][3] . . .

76 92 108 124 140 156 172

Cache Performance Metrics

- Huge difference between a cache hit and a cache miss
  - Could be 100x speed difference between accessing cache and main memory (measured in *clock cycles*)
- Miss Rate (MR)
  - Fraction of memory references not found in cache (misses / accesses) = 1 - Hit Rate
- Hit Time (HT)
  - Time to deliver a block in the cache to the processor
    - Includes time to determine whether the block is in the cache
- Miss Penalty (MP)
  - Additional time required because of a miss

Cache Performance

- Two things hurt the performance of a cache:
  - Miss rate and miss penalty

- *Average Memory Access Time* (AMAT): average time to access memory considering both hits and misses

  AMAT = Hit time + Miss rate × Miss penalty

  (abbreviated AMAT = HT + MR × MP)

- 99% hit rate twice as good as 97% hit rate!
  - Assume HT of 1 clock cycle and MP of 100 clock cycles
  - 97%: AMAT =
  - 99%: AMAT =

Polling Question

- **Processor specs:** 200 ps clock, MP of 50 clock cycles, MR of 0.02 misses/instruction, and HT of 1 clock cycle

  AMAT =

- Which improvement would be best?
  - Vote at http://PollEv.com/rea

A. 190 ps clock

B. Miss penalty of 40 clock cycles

C. MR of 0.015 misses/instruction

Can we have more than one cache?

- Why would we want to do that?
  - Avoid going to memory!
- Typical performance numbers:
  - Miss Rate
    - L1 MR = 3-10%
    - L2 MR = Quite small (*e.g.* < 1%), depending on parameters, etc.
  - Hit Time
    - L1 HT = 4 clock cycles
    - L2 HT = 10 clock cycles
  - Miss Penalty
    - P = 50-200 cycles for missing in L2 & going to main memory
    - Trend: increasing!

Summary

- Memory Hierarchy
  - Successively higher levels contain “most used” data from lower levels
  - Exploits *temporal and spatial locality*
  - Caches are intermediate storage levels used to optimize data transfers between any system elements with different characteristics
- Cache Performance
  - Ideal case: found in cache (hit)
  - Bad case: not found in cache (miss), search in next level
  - Average Memory Access Time (AMAT) = HT + MR × MP
    - Hurt by Miss Rate and Miss Penalty
