CSE 351 Section 2 - Pointers and Bit Operators

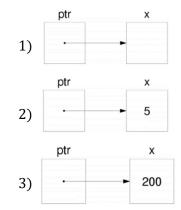

Pointers

A pointer is a variable that holds an address. C uses pointers explicitly. If we have a variable x, then &x gives the address of x rather than the value of x. If we have a pointer p, then *p gives us the value that p points to, rather than the value of p.

Consider the following declarations and assignments:

```
int x;
int *ptr;
ptr = &x;
```

- 1) We can represent the result of these three lines of code visually as shown. The variable ptr stores the address of x, and we say "ptr points to x." x currently doesn't contain a value since we did not assign x a value!
- 2) After executing x = 5; the memory diagram changes as shown.
- 3) After executing *ptr = 200;, the memory diagram changes as shown. We modified the value of x by dereferencing ptr.

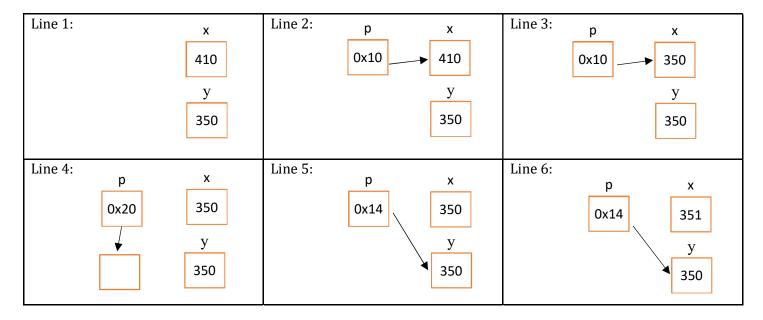

Pointer Arithmetic

In C, arithmetic on pointers (++, +, --, -) is scaled by the size of the data type the pointer points to. That is, if p is declared with pointer **type*** p, then p + i will change the value of p (an address) by i*sizeof(type) (in bytes). If there is a line *p = *p + 1, pointer arithmetic will only apply to *p = *p + 1 if p is a pointer to a pointer. If p is not a type of pointer to a pointer, regular arithmetic will apply.

Exercise:

Draw out the memory diagram after sequential execution of each of the lines below:

C Bitwise Operators

&01
$$\leftarrow$$
AND (&) outputs a 1 only when both input bits are 1.I01000110101 \bullet 01 \bullet 01001 \bullet 01110NOT (~) outputs the opposite of its input. \rightarrow 10

Masking is very commonly used with bitwise operations. A mask is a binary constant used to manipulate another bit string in a specific manner, such as setting specific bits to 1 or 0.

Exercises:

1) What happens when we fix/set one of the inputs to the 2-input gates? Let x be the other input. Fill in the following blanks with either 0, 1, x, or \bar{x} (NOT x):

$$x & 0 = 0$$
 $x & 0 = x$ $x & 0 = x$ $x & 1 = x$ $x & 1 = x$

2) **Lab 1 Helper Exercises:** Lab 1 is intended to familiarize you with bitwise operations in C through a series of puzzles. These exercises are either sub-problems directly from the lab or expose concepts needed to complete the lab. Start early!

```
Bit Extraction: Returns the value (0 or 1) of the 19th bit (counting from LSB). Allowed operators: >>, &, |, \sim.
     int extract19(int x) {
          return (x >> 18) & 0x1;
Subtraction: Returns the value of x-y. Allowed operators: >>, &, |, \sim, +.
     int subtract(int x, int y) {
          return x + ((\sim y) + 1);
Equality: Returns the value of x==y. Allowed operators: >>, &, |, \sim, +, ^{\wedge}, !.
     int equals(int x, int y) {
          return ! (x ^ y);
Divisible by Eight? Returns the value of (x\%8)==0. Allowed operators: >>, <<, &, |, ~, +, ^, !.
     int divisible by 8(int x) {
          return ! (\bar{x} << 29);
Greater than Zero? Returns the value of x>0. Allowed operators: >>, \&, |, \sim, +, ^{\wedge}, !.
     int greater than 0(int x) {
           /* invert and check sign; we need the third operand for the T_min case */
          return ((\sim x + 1) >> 31) \& 0x1 \& \sim (x >> 31) OR !!x \& \sim (x >> 31);
```
