Relevant Course Information

- ❖ Lab 1b grades released
 - Regrade requests open Tuesday – Thursday
- ❖ Lab 2 due Friday (10/29)
 - Since you are submitting a text file (`defuser.txt`), there won't be any Gradescope autograder output this time
 - Extra credit (bonus) needs to be submitted to the extra credit assignment
- ❖ Midterm (take home, 11/3–11/5)
 - Make notes and use the [midterm reference sheet](#)
 - Form study groups and look at past exams!

Polling Question

Vote only on 3rd question on Ed Lessons

- ❖ Answer the following questions about when `main()` is run (assume `x` and `y` stored on the Stack):

```
int main() {
    int i, x = 0;
    for(i=0; i<3; i++)
        x = randSum(x);
    printf("x = %d\n", x);
    return 0;
}
```

```
int randSum(int n) {
    int y = rand()%20;
    return n+y;
}
```

- *Higher/larger address:* `x` or `y`?
- How many total stack frames are *created*?
- What is the maximum *depth* (# of frames) of the Stack?

A. 1 B. 2 C. 3 D. 4

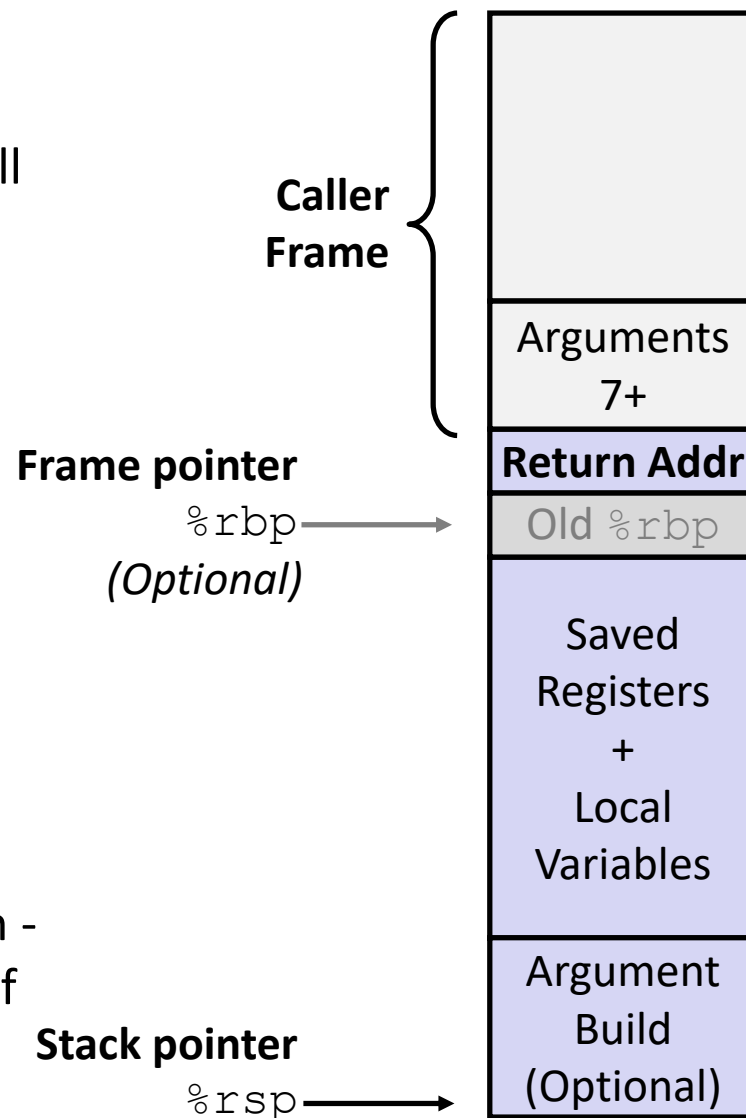

Reading Review

- ❖ Terminology:
 - Stack frame: return address, saved registers, local variables, argument build
 - Register saving conventions: callee-saved and caller-saved

- ❖ Questions from the Reading?

x86-64/Linux Stack Frame (Review)

- ❖ **Caller's Stack Frame**
 - Extra arguments (if > 6 args) for this call
- ❖ **Current/Callee Stack Frame**
 - Return address
 - Pushed by `call` instruction
 - Old frame pointer (optional)
 - Saved register context (when reusing registers)
 - Local variables (If can't be kept in registers)
 - "Argument build" area (If callee needs to call another function - parameters for function about to call, if needed)

Review Question

- ❖ In the following function, which instruction(s) pertain to the **local variables** and **saved registers** portions of its stack frame?

```
call_incr2:
1  pushq   %rbx
2  subq    $16, %rsp
3  movq    %rdi, %rbx
4  movq    $351, 8(%rsp)
5  movl    $100, %esi
6  leaq    8(%rsp), %rdi
7  call    increment
8  addq    %rbx, %rax
9  addq    $16, %rsp
10 popq    %rbx
11 ret
```

Example: increment

```
long increment(long* p, long val) {  
    long x = *p;  
    long y = x + val;  
    *p = y;  
    return x;  
}
```

increment:

```
movq    (%rdi), %rax  
addq    %rax, %rsi  
movq    %rsi, (%rdi)  
ret
```

Register	Use(s)
%rdi	1 st arg (p)
%rsi	2 nd arg (val), y
%rax	x, return value

Procedure Call Example (initial state)

```
long call_incr() {  
    long v1 = 351;  
    long v2 = increment(&v1, 100);  
    return v1 + v2;  
}
```

```
call_incr:  
subq    $16, %rsp  
movq    $351, 8(%rsp)  
movl    $100, %esi  
leaq    8(%rsp), %rdi  
call    increment  
addq    8(%rsp), %rax  
addq    $16, %rsp  
ret
```

Initial Stack Structure

- ❖ Return address on stack is the address of instruction immediately *following* the call to “call_incr”
 - Shown here as main, but could be anything)
 - Pushed onto stack by call call_incr

Procedure Call Example (step 1)

```
long call_incr() {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return v1 + v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq    8(%rsp), %rdi
    call    increment
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

} Allocate space
for local vars

Stack Structure

- ❖ Setup space for local variables
 - Only v1 needs space on the stack
- ❖ Compiler allocated extra space
 - Often does this for a variety of reasons, including alignment

Procedure Call Example (step 2)

```
long call_incr() {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return v1 + v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq    8(%rsp), %rdi
    call    increment
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

} Set up parameters for call
to increment

Stack Structure

Aside: `movl` is used because 100 is a small positive value that fits in 32 bits. High order bits of `rsi` get set to zero automatically. It takes *one less byte* to encode a `movl` than a `movq`.

Register	Use(s)
<code>%rdi</code>	<code>&v1</code>
<code>%rsi</code>	100

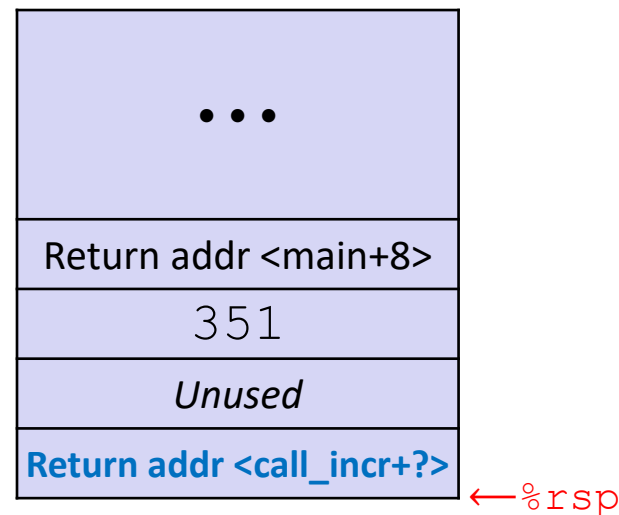

Procedure Call Example (step 3)

```
long call_incr() {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return v1 + v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq    8(%rsp), %rdi
    call   increment
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

```
increment:
    movq    (%rdi), %rax
    addq    %rax, %rsi
    movq    %rsi, (%rdi)
    ret
```

Stack Structure

- ❖ State while inside `increment`
 - **Return address** on top of stack is address of the `addq` instruction immediately following call to `increment`

Register	Use(s)
%rdi	&v1
%rsi	100
%rax	

Procedure Call Example (step 4)

```
long call_incr() {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return v1 + v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq    8(%rsp), %rdi
    call   increment
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

```
increment:
    movq    (%rdi), %rax # x = *p
    addq    %rax, %rsi   # y = x + 100
    movq    %rsi, (%rdi) # *p = y
    ret
```

Stack Structure

- ❖ State while inside `increment`
 - *After* code in body has been executed

Register	Use(s)
%rdi	&v1
%rsi	451
%rax	351

Procedure Call Example (step 5)

```

long call_incr() {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return v1 + v2;
}

```

```

call_incr:
    subq    $16, %rsp
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq    8(%rsp), %rdi
    call    increment
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret

```

Stack Structure

- ❖ After returning from call to `increment`
 - Registers and memory have been modified and return address has been popped off stack

Register	Use(s)
%rdi	&v1
%rsi	451
%rax	351

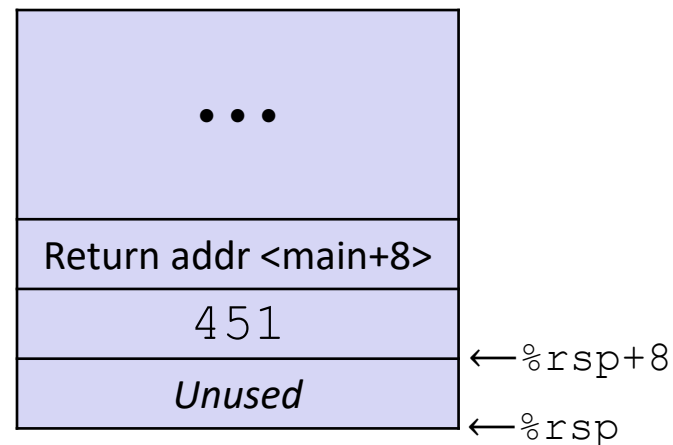

Procedure Call Example (step 6)

```
long call_incr() {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return v1 + v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq    8(%rsp), %rdi
    call    increment
    addq    8(%rsp), %rax
    addq    $16, %rsp
    ret
```

← Update %rax to contain v1+v2

Stack Structure

Register	Use(s)
%rdi	&v1
%rsi	451
%rax	451+351

Procedure Call Example (step 7)

```
long call_incr() {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return v1 + v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq   8(%rsp), %rdi
    call   increment
    addq   8(%rsp), %rax
    addq   $16, %rsp
    ret
```

← De-allocate space for local vars

Stack Structure

Register	Use(s)
%rdi	&v1
%rsi	451
%rax	802

Procedure Call Example (step 8)

```
long call_incr() {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return v1 + v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq   8(%rsp), %rdi
    call   increment
    addq   8(%rsp), %rax
    addq   $16, %rsp
    ret
```

Stack Structure

- ❖ State *just before* returning from call to `call_incr`

Register	Use(s)
%rdi	&v1
%rsi	451
%rax	802

Procedure Call Example (step 9)

```
long call_incr() {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return v1 + v2;
}
```

```
call_incr:
    subq    $16, %rsp
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq   8(%rsp), %rdi
    call   increment
    addq   8(%rsp), %rax
    addq   $16, %rsp
    ret
```

Final Stack Structure

- ❖ State immediately *after* returning from call to `call_incr`
 - Return addr has been popped off stack
 - Control has returned to the instruction immediately following the call to `call_incr` (not shown here)

Register	Use(s)
%rdi	&v1
%rsi	451
%rax	802

Procedures

- ❖ Stack Structure
- ❖ Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- ❖ **Register Saving Conventions**
- ❖ Illustration of Recursion

Register Saving Conventions (Review)

- ❖ When procedure `whoa` calls `who`:
 - `whoa` is the *caller*
 - `who` is the *callee*
- ❖ Can registers be used for temporary storage?

```
whoa:  
  . . .  
  movq $15213, %rdx  
  call who  
  addq %rdx, %rax  
  . . .  
  ret
```

```
who:  
  . . .  
  subq $18213, %rdx  
  . . .  
  ret
```

- No! Contents of register `%rdx` overwritten by `who`!
- This could be trouble – something should be done. Either:
 - *Caller* should save `%rdx` before the call (and restore it after the call)
 - *Callee* should save `%rdx` before using it (and restore it before returning)

Register Saving Conventions (Review)

❖ “*Caller-saved*” registers

- It is the **caller**'s responsibility to save any important data in these registers before calling another procedure (*i.e.*, the **callee** can freely change data in these registers)
- **Caller** saves values in its stack frame before calling **Callee**, then restores values after the call

❖ “*Callee-saved*” registers

- It is the callee's responsibility to save any data in these registers before using the registers (*i.e.*, the **caller** assumes the data will be the same across the **callee** procedure call)
- **Callee** saves values in its stack frame before using, then restores them before returning to **caller**

Silly Register Convention Analogy

- 1) Parents (*caller*) leave for the weekend and give the keys to the house to their child (*callee*)
 - Being suspicious, they put away/hid the valuables (*caller-saved*) before leaving
 - Warn child to leave the bedrooms untouched: “These rooms better look the same when we return!”
- 2) Child decides to throw a wild party (*computation*), spanning the entire house
 - To avoid being disowned, child moves all of the stuff from the bedrooms to the backyard shed (*callee-saved*) before the guests trash the house
 - Child cleans up house after the party and moves stuff back to bedrooms
- 3) Parents return home and are satisfied with the state of the house
 - Move valuables back and continue with their lives

x86-64 Linux Register Usage (Review)

❖ `%rax`

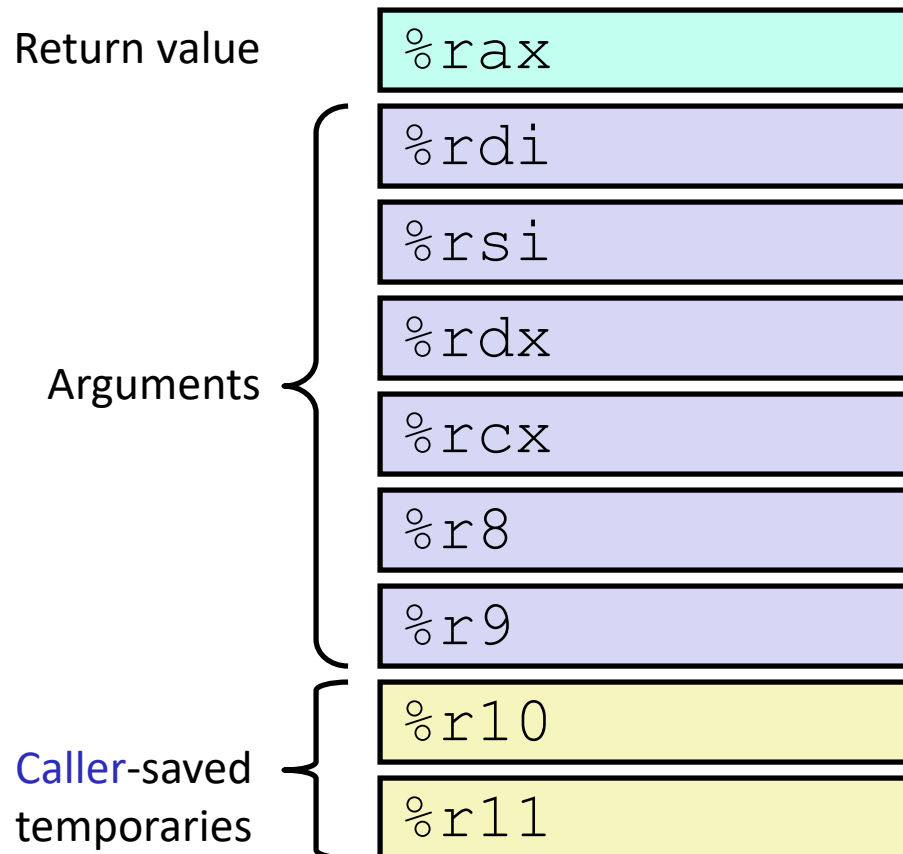

- Return value
- Also **caller**-saved & restored
- Can be modified by procedure

❖ `%rdi, ..., %r9`

- Arguments
- Also **caller**-saved & restored
- Can be modified by procedure

❖ `%r10, %r11`

- **Caller**-saved & restored
- Can be modified by procedure

x86-64 Linux Register Usage (Review)

❖ `%rbx`, `%r12`, `%r13`, `%r14`, `%r15`

- **Callee**-saved
- **Callee** must save & restore

❖ `%rbp`

- **Callee**-saved
- **Callee** must save & restore
- May be used as frame pointer
- Can mix & match

❖ `%rsp`

- Special form of **callee** save
- Restored to original value upon exit from procedure

Callee-saved
Temporaries

Special

x86-64 Linux Register Usage (Review)

<code>%rax</code>	Return value - Caller saved
<code>%rbx</code>	Callee saved
<code>%rcx</code>	Argument #4 - Caller saved
<code>%rdx</code>	Argument #3 - Caller saved
<code>%rsi</code>	Argument #2 - Caller saved
<code>%rdi</code>	Argument #1 - Caller saved
<code>%rsp</code>	Stack pointer
<code>%rbp</code>	Callee saved

<code>%r8</code>	Argument #5 - Caller saved
<code>%r9</code>	Argument #6 - Caller saved
<code>%r10</code>	Caller saved
<code>%r11</code>	Caller Saved
<code>%r12</code>	Callee saved
<code>%r13</code>	Callee saved
<code>%r14</code>	Callee saved
<code>%r15</code>	Callee saved

Callee-Saved Example (step 1)

```
long call_incr2(long x) {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return x + v2;
}
```

```
call_incr2:
    pushq    %rbx
    subq    $16, %rsp
    movq    %rdi, %rbx
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq    8(%rsp), %rdi
    call    increment
    addq    %rbx, %rax
    addq    $16, %rsp
    popq    %rbx
    ret
```

Initial Stack Structure

Resulting Stack Structure

Callee-Saved Example (step 2)

```
long call_incr2(long x) {
    long v1 = 351;
    long v2 = increment(&v1, 100);
    return x + v2;
}
```

```
call_incr2:
    pushq    %rbx
    subq    $16, %rsp
    movq    %rdi, %rbx
    movq    $351, 8(%rsp)
    movl    $100, %esi
    leaq    8(%rsp), %rdi
    call    increment
    addq    %rbx, %rax
    addq    $16, %rsp
    popq    %rbx
    ret
```

Stack Structure

Pre-return Stack Structure

Why Caller *and* Callee Saved?

- ❖ We want *one* calling convention to simply separate implementation details between caller and callee
- ❖ In general, neither caller-save nor callee-save is “best”:
 - If caller isn’t using a register, caller-save is better
 - If callee doesn’t need a register, callee-save is better
 - If “do need to save”, callee-save generally makes smaller programs
 - Functions are called from multiple places
- ❖ So... “some of each” and compiler tries to “pick registers” that minimize amount of saving/restoring

Register Conventions Summary

- ❖ **Caller**-saved register values need to be pushed onto the stack before making a procedure call *only if the Caller needs that value later*
 - **Callee** may change those register values
- ❖ **Callee**-saved register values need to be pushed onto the stack *only if the Callee intends to use those registers*
 - **Caller** expects unchanged values in those registers
- ❖ Don't forget to restore/pop the values later!

Procedures

- ❖ Stack Structure
- ❖ Calling Conventions
 - Passing control
 - Passing data
 - Managing local data
- ❖ Register Saving Conventions
- ❖ **Illustration of Recursion**

Recursive Function

```
/* Recursive popcount */  
long pcount_r(unsigned long x) {  
    if (x == 0)  
        return 0;  
    else  
        return (x & 1) + pcount_r(x >> 1);  
}
```

Counts the number of 1's in the binary representation of x.

Compiler Explorer:

<https://godbolt.org/z/naP4ax>

- Compiled with `-O1` instead of `-Og` for more natural instruction ordering

```
pcount_r:  
    movl    $0, %eax  
    testq   %rdi, %rdi  
    jne     .L8  
    ret  
.L8:  
    pushq   %rbx  
    movq    %rdi, %rbx  
    shrq    %rdi  
    call    pcount_r  
    andl    $1, %ebx  
    addq    %rbx, %rax  
    popq    %rbx  
    ret
```

Recursive Function: Base Case

```

/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1) + pcount_r(x >> 1);
}

```

Register	Use(s)	Type
%rdi	x	Argument
%rax	Return value	Return value

```

pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    jne    .L8
    ret

.L8:
    pushq  %rbx
    movq   %rdi, %rbx
    shrq   %rdi
    call   pcount_r
    andl   $1, %ebx
    addq   %rbx, %rax
    popq   %rbx
    ret

```

Recursive Function: Callee Register Save

```

/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1) + pcount_r(x >> 1);
}

```

Register	Use(s)	Type
%rdi	x	Argument

The Stack

Need original value of x after recursive call to `pcount_r`.

“Save” by putting in `%rbx` (callee saved), but need to save old value of `%rbx` before you change it.

```

pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    jne    .L8
    ret
.L8:
    pushq  %rbx
    movq   %rdi, %rbx
    shrq   %rdi
    call   pcount_r
    andl   $1, %ebx
    addq   %rbx, %rax
    popq   %rbx
    ret

```

Recursive Function: Call Setup

```

/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1) + pcount_r(x >> 1);
}
    
```

Register	Use(s)	Type
%rdi	x (new)	Argument
%rbx	x (old)	Callee saved

The Stack

```

pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    jne    .L8
    ret
.L8:
    pushq  %rbx
    movq   %rdi, %rbx
    shrq   %rdi
    call   pcount_r
    andl   $1, %ebx
    addq   %rbx, %rax
    popq   %rbx
    ret
    
```

Recursive Function: Call

```

/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1) + pcount_r(x >> 1);
}

```

The Stack

Register	Use(s)	Type
%rax	Recursive call return value	Return value
%rbx	x (old)	Callee saved

```

pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    jne     .L8
    ret
.L8:
    pushq   %rbx
    movq    %rdi, %rbx
    shrq    %rdi
    call    pcount_r
    andl    $1, %ebx
    addq    %rbx, %rax
    popq    %rbx
    ret

```

Recursive Function: Result

```

/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1) + pcount_r(x >> 1);
}
    
```

Register	Use(s)	Type
%rax	Return value	Return value
%rbx	x&1	Callee saved

The Stack

```

pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    jne     .L8
    ret
.L8:
    pushq   %rbx
    movq    %rdi, %rbx
    shrq    %rdi
    call    pcount_r
    andl    $1, %ebx
    addq    %rbx, %rax
    popq    %rbx
    ret
    
```

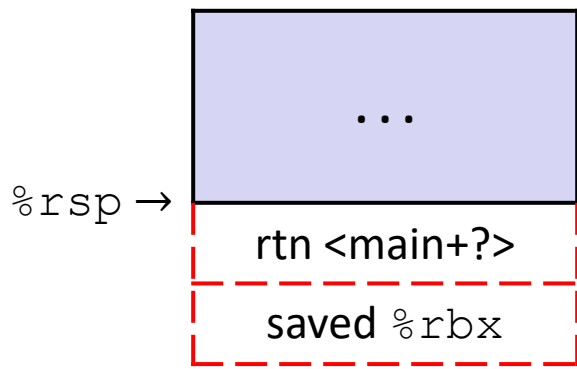

Recursive Function: Completion

```

/* Recursive popcount */
long pcount_r(unsigned long x) {
    if (x == 0)
        return 0;
    else
        return (x & 1) + pcount_r(x >> 1);
}
    
```

Register	Use(s)	Type
%rax	Return value	Return value
%rbx	Previous %rbx value	Callee restored

The Stack

```

pcount_r:
    movl    $0, %eax
    testq   %rdi, %rdi
    jne     .L8
    ret
.L8:
    pushq   %rbx
    movq    %rdi, %rbx
    shrq    %rdi
    call    pcount_r
    andl    $1, %ebx
    addq    %rbx, %rax
    popq    %rbx
    ret
    
```

Observations About Recursion

- ❖ Works without any special consideration
 - Stack frames mean that each function call has private storage
 - Saved registers & local variables
 - Saved return address
 - Register saving conventions prevent one function call from corrupting another's data
 - Unless the code explicitly does so (*e.g.* buffer overflow)
 - Stack discipline follows call / return pattern
 - If P calls Q, then Q returns before P
 - Last-In, First-Out (LIFO)
- ❖ Also works for mutual recursion (P calls Q; Q calls P)

x86-64 Stack Frames

- ❖ Many x86-64 procedures have a minimal stack frame
 - Only return address is pushed onto the stack when procedure is called
- ❖ A procedure *needs* to grow its stack frame when it:
 - Has too many local variables to hold in **caller**-saved registers
 - Has local variables that are arrays or structs
 - Uses `&` to compute the address of a local variable
 - Calls another function that takes more than six arguments
 - Is using **caller**-saved registers and then calls a procedure
 - Modifies/uses **callee**-saved registers

x86-64 Procedure Summary

- ❖ Important Points
 - Procedures are a **combination of *instructions and conventions***
 - Conventions prevent functions from disrupting each other
 - Stack is the right data structure for procedure call/return
 - If P calls Q, then Q returns before P
 - Recursion handled by normal calling conventions
- ❖ Heavy use of registers
 - Faster than using memory
 - Use limited by data size and conventions
- ❖ Minimize use of the Stack
