- ❖ Lab 0 due ~~today~~ ^{Sunday} @ 11:59 pm
 - *You will revisit these concepts later!*
- ❖ hw1 due ~~today~~ @ 11:59 pm
- ❖ hw2 due Monday, hw3 due Wednesday @ 11:00 am
 - Autograded, unlimited tries, no late submissions
- ❖ Lab 1a released today, due next Friday (1/15)
 - Pointers in C
 - Reminder: last submission graded, *individual* work

National Events, Resources, and Week 1

- ❖ Blog post by UW President Cauce:
 - <https://www.washington.edu/president/2021/01/06/misinformation-disinformation-and-the-assault-on-democracy/>
- ❖ Be there for each other, check in with friends and classmates, give space to process
- ❖ Support resources:
 - CSE Undergraduate Advising: ugrad-adviser@cs.washington.edu
 - Hall Health and Schmitz Hall Counseling Center: <https://wellbeing.uw.edu/topic/mental-health/>
 - [SafeCampus](#) is the UW's central reporting office if you are concerned for yourself or a friend. They have trained specialists who will take your call and connect you with appropriate resources. They are available 24/7 at 206-685-SAFE (206-685-7233).
- ❖ CSE 351: all week 1 work due Sunday 1/10 @ 11:59pm

Reading Review

❖ Terminology:

- address-of operator (&), dereference operator (*), NULL
- box-and-arrow memory diagrams
- pointer arithmetic, arrays
- C string, null character, string literal

❖ Questions from the Reading?

Review Questions

- ❖ `int x = 351;`
`char *p = &x;`
`int ar[3];`
- ❖ How much space does the variable `p` take up?

- A. 1 byte
- B. 2 bytes
- C. 4 bytes
- D. 8 bytes

- ❖ Which of the following expressions evaluate to an address?

~~A.~~ `x + 10` ← int

B. `p + 10`

C. `&x + 10`

D. `*(&p)` ← address of ptr
reference

~~E.~~ `ar[1]` ← int

F. `&ar[2]` ← address of
`ar[2]` → ptr

Pointer Operators

- ❖ **&** = “address of” operator
- ❖ ***** = “value at address” or “dereference” operator

*char * p = &x*

- ❖ Operator confusion
 - The pointer operators are *unary* (i.e., take 1 operand)
 - These operators both have *binary* forms
 - $x \ \& \ y$ is bitwise AND (we'll talk about this next lecture)
 - $x \ * \ y$ is multiplication
 - * is also used as part of the data type in pointer variable declarations – this is NOT an operator in this context!

not pointer ops →

*char * p ;*
char * type of pointer

Assignment in C

32-bit example
(pointers are 32-bits wide)

little-endian

- ❖ A variable is represented by a location
- ❖ Declaration \neq initialization (initially holds “garbage”)
- ❖ **int** x, y;
 - x is at address 0x04, y is at 0x18

& = "address of"
* = "dereference"

z → dereference
z → illegal*
z y → multiplication*

❖ `int x, y;`

❖ `x = 0;`

❖ `y = 0x3CD02700;`

❖ `x = y + 3;`

- Get value at y, add 3, store in x

❖ `int* z = &y + 3;`

- Get address of y, add 12, store in z

The target of a pointer
is also a location

❖ `*z = y;`

- Get value of y, put in address stored in z

Addresses and Pointers in C

- ❖ Draw out a box-and-arrow diagram for the result of the following C code:

① `int* ptr;`
`int x = 5;`
`int y = 2;`

② `ptr = &x;`

③ `y = 1 + *ptr;` $\overset{\text{5}}{\rightarrow}$ $= 6$

Representing strings

- ❖ C-style string stored as an array of bytes (char*)
 - No “String” keyword, unlike Java
 - Elements are one-byte **ASCII codes** for each character

Representing strings

- ❖ C-style string stored as an array of bytes (**char***)
 - No “String” keyword, unlike Java
 - Elements are one-byte **ASCII codes** for each character
 - Last character followed by a 0 byte (`' \0 '`)
(a.k.a. "**null terminator**")

<i>Decimal:</i>	80	108	101	97	115	101	32	118	111	116	101	33	0
<i>Hex:</i>	0x50	0x6C	0x65	0x61	0x73	0x65	0x20	0x76	0x6F	0x74	0x65	0x21	0x00
<i>Text:</i>	'P'	'l'	'e'	'a'	's'	'e'		'v'	'o'	't'	'e'	'!'	'\0'

C (char = 1 byte)

Endianness and Strings

```
char s[6] = "12345";
```

String literal

0x31 = 49 decimal = ASCII '1'

IA32, x86-64

(little-endian)

SPARC

(big-endian)

0x00	31	↔	31	0x00	'1'
0x01	32	↔	32	0x01	'2'
0x02	33	↔	33	0x02	'3'
0x03	34	↔	34	0x03	'4'
0x04	35	↔	35	0x04	'5'
0x05	00	↔	00	0x05	'\0'

- ❖ Byte ordering (endianness) is not an issue for 1-byte values
 - The whole array does not constitute a single value
 - Individual elements are values; chars are single bytes

Examining Data Representations

❖ Code to print byte representation of data

- Treat any data type as a *byte array* by **casting** its address to `char*`
- C has unchecked casts **!! DANGER !!**

```
void show_bytes(char* start, int len) {  
    int i;  
    for (i = 0; i < len; i++)  
        printf("%p\t0x%.2hhX\n", start+i, *(start+i));  
    printf("\n");  
}
```

❖ `printf` directives:

- `%p` Print pointer
- `\t` Tab
- `%.2hhX` Print value as char (hh) in hex (X), padding to 2 digits (.2)
- `\n` New line

Examining Data Representations

❖ Code to print byte representation of data

- Treat any data type as a *byte array* by **casting** its address to `char*`
- C has **unchecked** casts **!! DANGER !!**

```
void show_bytes(char* start, int len) {  
    int i;  
    for (i = 0; i < len; i++)  
        printf("%p\t0x%.2hhX\n", start+i, *(start+i));  
    printf("\n");  
}
```

```
void show_int(int x) {  
    show_bytes( (char *) &x, sizeof(int));  
}
```

show_bytes Execution Example

```
int x = 123456; // 0x00 01 E2 40
printf("int x = %d;\n", x);
show_int(x);    // show_bytes((char *) &x, sizeof(int));
```

❖ Result (Linux x86-64):

- **Note:** The addresses will change on each run (try it!), but fall in same general range

```
int x = 123456;
0x7fffb245549c  0x40
0x7fffb245549d  0xE2
0x7fffb245549e  0x01
0x7fffb245549f  0x00
```

Summary

- ❖ Assignment in C results in value being put in memory location
- ❖ Pointer is a C representation of a data address
 - $\&$ = “address of” operator
 - $*$ = “value at address” or “dereference” operator
- ❖ Pointer arithmetic scales by size of target type
 - Convenient when accessing array-like structures in memory
 - Be careful when using – particularly when *casting* variables
- ❖ Arrays are adjacent locations in memory storing the same type of data object
 - Strings are null-terminated arrays of characters (ASCII)
