Administrivia

- Lab 0 due today @ 11:59 pm
 - You will revisit these concepts later!
- hw1 due today @ 11:59 pm
- hw2 due Monday, hw3 due Wednesday @ 11:00 am
 - Autograded, unlimited tries, no late submissions
- Lab 1a released today, due next Friday (1/15)
 - Pointers in C
 - Reminder: last submission graded, individual work

National Events, Resources, and Week 1

- Blog post by UW President Cauce:
 - https://www.washington.edu/president/2021/01/06/misinformat ion-disinformation-and-the-assault-on-democracy/
- Be there for each other, check in with friends and classmates, give space to process
- Support resources:
 - CSE Undergraduate Advising: <u>ugrad-adviser@cs.washington.edu</u>
 - Hall Health and Schmitz Hall Counseling Center: https://wellbeing.uw.edu/topic/mental-health/
 - SafeCampus is the UW's central reporting office if you are concerned for yourself or a friend. They have trained specialists who will take your call and connect you with appropriate resources. They are available 24/7 at 206-685-SAFE (206-685-7233).
- ❖ CSE 351: all week 1 work due Sunday 1/10 @ 11:59pm

Reading Review

- Terminology:
 - address-of operator (&), dereference operator (*), NULL
 - box-and-arrow memory diagrams
 - pointer arithmetic, arrays
 - C string, null character, string literal
- Questions from the Reading?

Review Questions

- * int x = 351;
 char *p = &x;
 int ar[3];
- How much space does the variable p take up?
 - A. 1 byte
 - B. 2 bytes
 - C. 4 bytes
 - D. 8 bytes

Which of the following expressions evaluate to an address?

$$A. x + 10$$

B.
$$p + 10$$

$$C. &x + 10$$

$$D. *(&p)$$

Pointer Operators

- & = "address of" operator
- * * = "value at address" or "dereference" operator
- Operator confusion
 - The pointer operators are unary (i.e., take 1 operand)
 - These operators both have binary forms
 - x & y is bitwise AND (we'll talk about this next lecture)
 - x * y is multiplication
 - * is also used as part of the data type in pointer variable declarations – this is NOT an operator in this context!

32-bit example (pointers are 32-bits wide)

little-endian

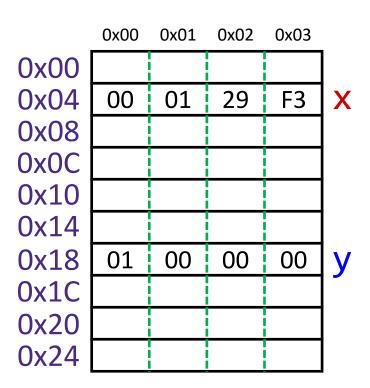

- A variable is represented by a location
- Declaration ≠ initialization (initially holds "garbage")
- * int x, y;
 - x is at address 0x04, y is at 0x18

	0x00	0x01	0x02	0x03	
0x00	A7	00	32	00]
0x04	00	01	29	F3	X
80x0	EE	EE	EE	EE	
0x0C	FA	CE	CA	FE]
0x10	26	00	00	00]
0x14	00	00	10	00]
0x18	01	00	00	00	y
0x1C	FF	00	F4	96	
0x20	DE	AD	BE	EF	
0x24	00	00	00	00	

32-bit example (pointers are 32-bits wide)

little-endian

- A variable is represented by a location
- Declaration ≠ initialization (initially holds "garbage")
- * int x, y;
 - x is at address 0x04, y is at 0x18

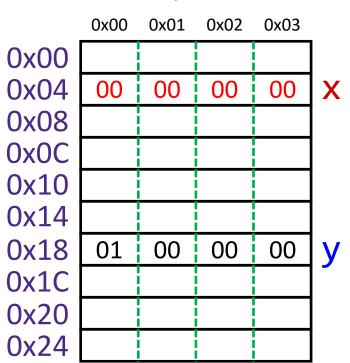

32-bit example (pointers are 32-bits wide)

& = "address of"

* = "dereference"

- left-hand side = right-hand side;
 - LHS must evaluate to a location
 - RHS must evaluate to a value (could be an address)
 - Store RHS value at LHS location
- * int x, y;
- * x = 0;

- 32-bit example (pointers are 32-bits wide)
 - & = "address of"

 * = "dereference"

- left-hand side = right-hand side;
 - LHS must evaluate to a location
 - RHS must evaluate to a value (could be an address)
 - Store RHS value at LHS location

*	ir	nt	x, y;
			0;
*	У	=	0x3CD02700; little endian

	0x00	0x01	0x02	0x03	_
0x00					
0x04	00	00	00	00	X
80x0					
0x0C					
0x10					
0x14					
0x18	00	27	D0	3C	y
0x1C					
0x20					
0x24					

32-bit example (pointers are 32-bits wide)

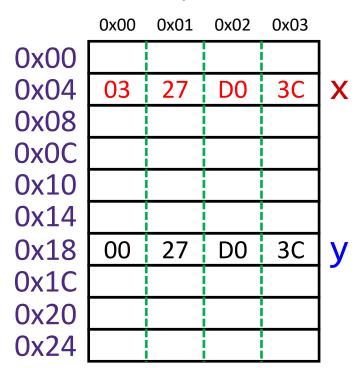

& = "address of"

* = "dereference"

- left-hand side = right-hand side;
 - LHS must evaluate to a location
 - RHS must evaluate to a value (could be an address)
 - Store RHS value at LHS location

*	in	t	x, y;
*	X	=	0;
*	У	=	0x3CD02700;
*	X	=	y + 3;

Get value at y, add 3, store in x

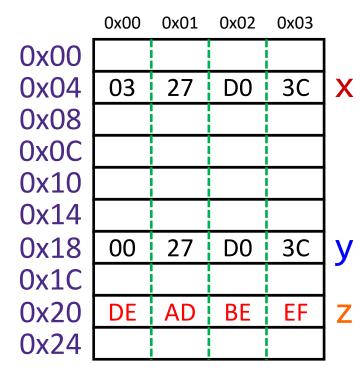

32-bit example (pointers are 32-bits wide)

& = "address of"

* = "dereference"

- left-hand side = right-hand side;
 - LHS must evaluate to a location
 - RHS must evaluate to a value (could be an address)
 - Store RHS value at LHS location
- * int x, y;
- * x = 0;
- * y = 0x3CD02700;
- * x = y + 3;
 - Get value at y, add 3, store in x
- * int* z;
 - z is at address 0x20

- 32-bit example (pointers are 32-bits wide)
 - & = "address of"

 * = "dereference"

- left-hand side = right-hand side;
 - LHS must evaluate to a location
 - RHS must evaluate to a value (could be an address)
 - Store RHS value at LHS location

$$* x = 0;$$

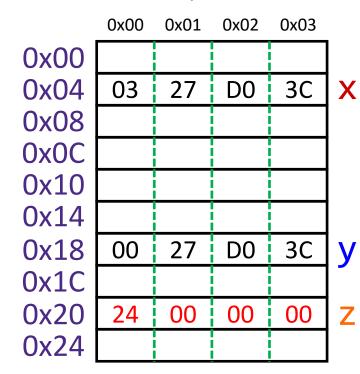

$$* y = 0x3CD02700;$$

$$* x = y + 3;$$

Get value at y, add 3, store in x

$$* int* z = &y + 3;$$

Get address of y, "add 3", store in z

M1-L3: Memory & Data II

$$x = 0;$$

$$* y = 0x3CD02700;$$

$$* x = y + 3;$$

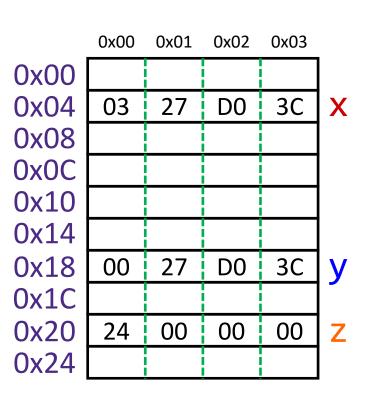

Get value at y, add 3, store in x

$$* int* z = &y + 3;$$

Get address of y, add 12, store in z

$$**z = y;$$

32-bit example (pointers are 32-bits wide)

$$x = 0;$$

$$* y = 0x3CD02700;$$

$$x = y + 3;$$

Get value at y, add 3, store in x

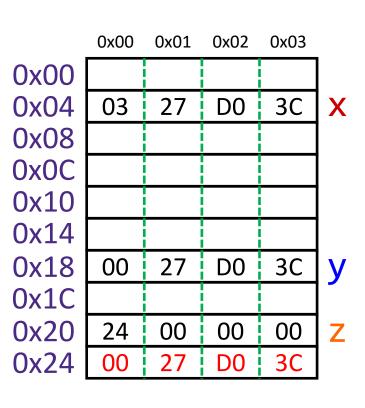

$$* int* z = &y + 3;$$

Get address of y, add 12, store in z

The target of a pointer is also a location

$$* *z = y$$

Get value of y, put in address stored in z 32-bit example (pointers are 32-bits wide)

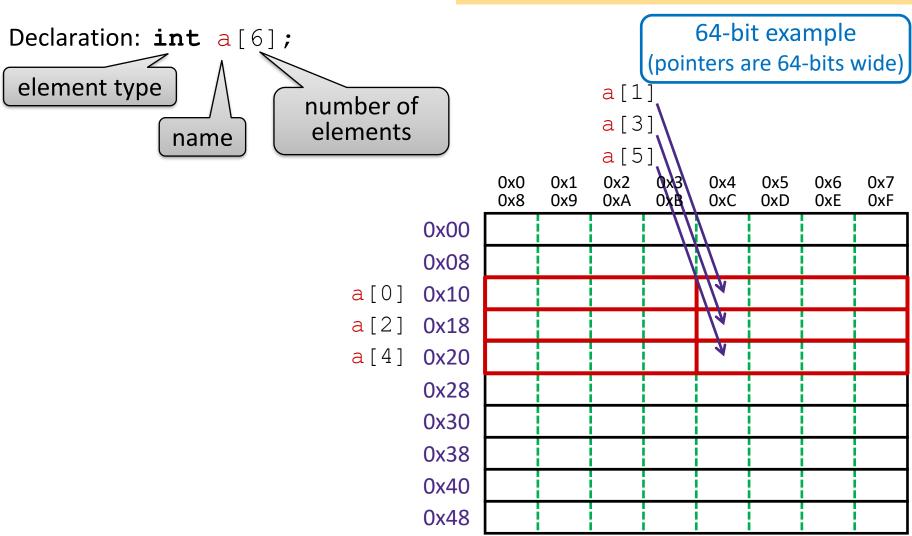

Addresses and Pointers in C

Draw out a box-and-arrow diagram for the result of the following C code:

```
int* ptr;
int x = 5;
int y = 2;
ptr = &x;
y = 1 + *ptr;
```

Arrays are adjacent locations in memory storing the same type of data object

a (array name) returns the array's address

Declaration: int a[6];

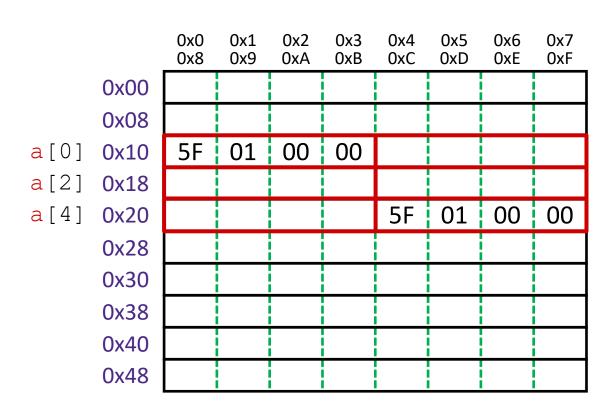

Indexing: a[0] = 0x015f;

a[5] = a[0];

Arrays are adjacent locations in memory storing the same type of data object

a (array name) returns the array's address

&a[i] is the address of a[0] plus i times the element size in bytes

Declaration: int a[6];

Indexing: a[0] = 0x015f;

a[5] = a[0];

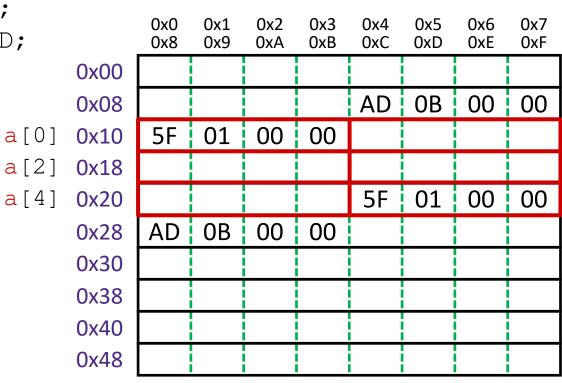

No bounds a[6] = 0xBAD;

checking: a[-1] = 0xBAD;

Arrays are adjacent locations in memory storing the same type of data object

a (array name) returns the array's address

&a [i] is the address of a [0] plus i times the element size in bytes

a[0]

a[2]

a [4]

p

Arrays in C

```
Declaration: int a[6];
```

Indexing: $a[0] = 0 \times 0.15f$;

a[5] = a[0];

No bounds a[6] = 0xBAD; checking: a[-1] = 0xBAD;

Pointers: int* p;

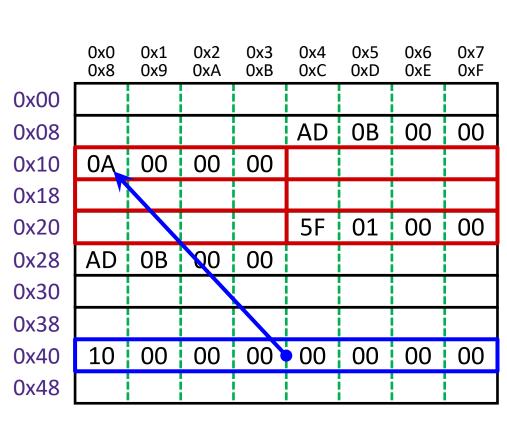

equivalent
$$\begin{cases} p = a; \\ p = &a[0]; \end{cases}$$

$$*p = 0xA;$$

Arrays are adjacent locations in memory storing the same type of data object

a (array name) returns the array's address

&a [i] is the address of a [0] plus i times the element size in bytes

a[0]

a[2]

a [4]

Arrays in C

Declaration: int a[6];

Indexing: a[0] = 0x015f;

a[5] = a[0];

No bounds a[6] = 0xBAD;

checking: a[-1] = 0xBAD;

Pointers: int* p;

equivalent
$$\begin{cases} p = a; \\ p = &a[0]; \end{cases}$$

$$*p = 0xA;$$

array indexing = address arithmetic (both scaled by the size of the type)

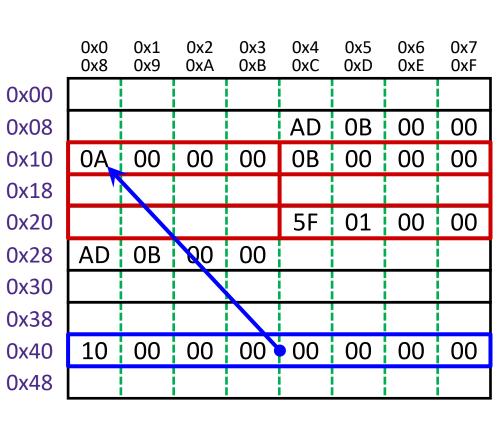

equivalent
$$\begin{cases} p[1] = 0xB; \\ *(p+1) = 0xB; \end{cases}$$

 $p = p + 2;$

Arrays are adjacent locations in memory storing the same type of data object

a (array name) returns the array's address

&a[i] is the address of a[0] plus i times the element size in bytes

Declaration: int a[6];

Indexing: a[0] = 0x015f;

a[5] = a[0];

No bounds a[6] = 0xBAD;

checking: a[-1] = 0xBAD;

Pointers: int* p;

equivalent
$$\begin{cases} p = a; \\ p = &a[0]; \end{cases}$$

*p = 0xA;

array indexing = address arithmetic (both scaled by the size of the type)

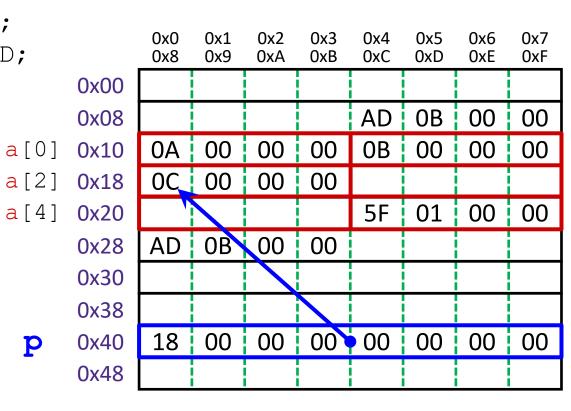

equivalent
$$\begin{cases} p[1] = 0xB; \\ *(p+1) = 0xB; \end{cases}$$

 $p = p + 2;$

Arrays are adjacent locations in memory storing the same type of data object

a (array name) returns the array's address

&a [i] is the address of a [0] plus i times the element size in bytes

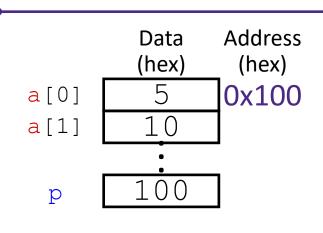

$$*p = a[1] + 1;$$

Question: The variable values after Line 3 executes are shown on the right. What are they after Line 5?

Vote in Ed Lessons

```
1  void main() {
2   int a[] = {0x5,0x10};
3   int* p = a;
4   p = p + 1;
5   *p = *p + 1;
6 }
```

	P	a [0]	a [1]
(A)	0x101	0x5	0x11
(B)	0x104	0x5	0x11
(C)	0x101	0x6	0x10
(D)	0x104	0×6	0x10

Representing strings

- C-style string stored as an array of bytes (char*)
 - No "String" keyword, unlike Java
 - Elements are one-byte ASCII codes for each character

32	space	48	0	64	@	80	Р	96	`	112	р
33	!	49	1	65	Α	81	Q	97	а	113	q
34	"	50	2	66	В	82	R	98	b	114	r
35	#	51	3	67	c	83	S	99	С	115	s
36	\$	52	4	68	D	84	Т	100	d	116	t
37	%	53	5	69	E	85	U	101	е	117	u
38	&	54	6	70	F	86	V	102	f	118	v
39	,	55	7	71	G	87	w	103	g	119	w
40	(56	8	72	н	88	Х	104	h	120	х
41)	57	9	73	- 1	89	Υ	105	- 1	121	у
42	*	58	:	74	J	90	Z	106	j	122	z
43	+	59	;	75	к	91	[107	k	123	{
44	,	60	<	76	L	92	\	108	1	124	1
45	-	61	=	77	М	93]	109	m	125	}
46		62	>	78	N	94	^	110	n	126	~
47	/	63	?	79	0	95	_	111	o	127	del

ASCII: American Standard Code for Information Interchange

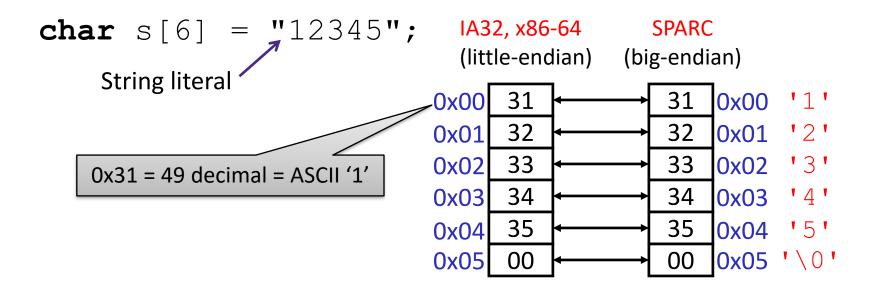

Representing strings

- C-style string stored as an array of bytes (char*)
 - No "String" keyword, unlike Java
 - Elements are one-byte ASCII codes for each character
 - Last character followed by a 0 byte ('\0')
 (a.k.a. "null terminator")

Decimal:	80	108	101	97	115	101	32	118	111	116	101	33	0
Нех:	0x50	0x6C	0x65	0x61	0x73	0x65	0x20	0x76	0x6F	0x74	0x65	0x21	0x00
Text:	'P'	'1'	'e'	'a'	's'	'e'		'v'	'o'	<u>'t'</u>	'e'	'!'	'\0'

C (char = 1 byte)

Endianness and Strings

- Byte ordering (endianness) is not an issue for 1-byte values
 - The whole array does not constitute a single value
 - Individual elements are values; chars are single bytes

Examining Data Representations

- Code to print byte representation of data
 - Treat any data type as a byte array by casting its address to char*
 - C has unchecked casts !! DANGER !!

```
void show_bytes(char* start, int len) {
  int i;
  for (i = 0; i < len; i++)
    printf("%p\t0x%.2hhX\n", start+i, *(start+i));
  printf("\n");
}</pre>
```

- printf directives:
 - %p Print pointer
 - \t Tab
 - %.2hhX Print value as char (hh) in hex (X), padding to 2 digits (.2)
 - \n New line

Examining Data Representations

- Code to print byte representation of data
 - Treat any data type as a byte array by casting its address to char*
 - C has unchecked casts !! DANGER !!

```
void show_bytes(char* start, int len) {
  int i;
  for (i = 0; i < len; i++)
    printf("%p\t0x%.2hhX\n", start+i, *(start+i));
  printf("\n");
}</pre>
```

```
void show_int(int x) {
   show_bytes( (char *) &x, sizeof(int));
}
```

show_bytes Execution Example

```
int x = 123456; // 0x00 01 E2 40
printf("int x = %d;\n", x);
show_int(x); // show_bytes((char *) &x, sizeof(int));
```

- Result (Linux x86-64):
 - Note: The addresses will change on each run (try it!), but fall in same general range

```
int x = 123456;

0x7fffb245549c  0x40

0x7fffb245549d  0xE2

0x7fffb245549e  0x01

0x7fffb245549f  0x00
```

Summary

- Assignment in C results in value being put in memory location
- Pointer is a C representation of a data address
 - & = "address of" operator
 - * = "value at address" or "dereference" operator
- Pointer arithmetic scales by size of target type
 - Convenient when accessing array-like structures in memory
 - Be careful when using particularly when *casting* variables
- Arrays are adjacent locations in memory storing the same type of data object
 - Strings are null-terminated arrays of characters (ASCII)
