

x86-64 Programming II

CSE 351 Winter 2021

Instructor:

Mark Wyse

Teaching Assistants:

Kyrie Dowling

Catherine Guevara

Ian Hsiao

Jim Limprasert

Armin Magness

Allie Pflieger

Cosmo Wang

Ronald Widjaja

<http://xkcd.com/99/>

Administrivia

- ❖ Lab 2 (x86-64) released today, due 2/5
 - Learn to read x86-64 assembly and use GDB
- ❖ Lecture readings – **due at 11:00am PST**
- ❖ Submissions that fail the autograder get a **ZERO**
 - No excuses – make full use of tools & Gradescope's interface
 - Some leeway was given on Lab 1, do not expect the same leniency moving forward
- ❖ hw8 due Wednesday, hw9 due Friday
- ❖ Study Guide 1 – due Friday 1/29

Extra Credit

- ❖ All labs starting with Lab 2 have extra credit portions
 - These are meant to be fun extensions to the labs
- ❖ Study Guides Task 1 and 2 can also be awarded extra credit, although this will be uncommon
- ❖ Extra credit points *don't* affect your lab/guide grades
 - From the course policies: “they will be accumulated over the course and will be used to bump up borderline grades at the end of the quarter.”
 - Make sure you finish the rest of the lab before attempting any extra credit

Reading Review

- ❖ Terminology:
 - Address Computation Instruction (`lea`)
 - Condition codes: Carry Flag (CF), Zero Flag (ZF), Sign Flag (SF), and Overflow Flag (OF)
 - Test (`test`) and compare (`cmp`) assembly instructions
 - Jump (`j*`) and set (`set*`) families of assembly instructions

- ❖ Questions from the Reading?

Complete Memory Addressing Modes

❖ General:

- $D(Rb, Ri, S) \quad \text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri] * S + D]$
 - Rb: Base register (any register)
 - Ri: Index register (any register except `%rsp`)
 - S: Scale factor (1, 2, 4, 8) – *why these numbers?*
 - D: Constant displacement value (a.k.a. immediate)

❖ Special cases (see CSPP Figure 3.3 on p.181)

- $D(Rb, Ri) \quad \text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri] + D] \quad (S=1)$
- $(Rb, Ri, S) \quad \text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri] * S] \quad (D=0)$
- $(Rb, Ri) \quad \text{Mem}[\text{Reg}[Rb] + \text{Reg}[Ri]] \quad (S=1, D=0)$
- $(, Ri, S) \quad \text{Mem}[\text{Reg}[Ri] * S] \quad (Rb=0, D=0)$

Review Questions

- ❖ Which of the following x86-64 instructions correctly calculates `%rax=9*%rdi`?
 - A. `leaq (,%rdi,9), %rax`
 - B. `movq (,%rdi,9), %rax`
 - C. `leaq (%rdi,%rdi,8), %rax`
 - D. `movq (%rdi,%rdi,8), %rax`
- ❖ If `%rsi` is `0x B0BACAFE 1EE7 F0 0D`, what is its value after executing `movswl %si, %esi`?

Address Computation Instruction

- ❖ `leaq src, dst`
 - "lea" stands for *load effective address*
 - `src` is address expression (any of the formats we've seen)
 - `dst` is a register
 - Sets `dst` to the *address* computed by the `src` expression (**does not go to memory! – it just does math**)
 - Example: `leaq (%rdx,%rcx,4), %rax`
- ❖ Uses:
 - Computing addresses without a memory reference
 - *e.g.*, translation of `p = &x[i];`
 - Computing arithmetic expressions of the form $x+k*i+d$
 - Though `k` can only be 1, 2, 4, or 8

Example: lea vs. mov

Registers

%rax	
%rbx	
%rcx	0x4
%rdx	0x100
%rdi	
%rsi	

Memory Word Address

0x400	0x120
0xF	0x118
0x8	0x110
0x10	0x108
0x1	0x100

```
leaq (%rdx,%rcx,4), %rax
movq (%rdx,%rcx,4), %rbx
leaq (%rdx), %rdi
movq (%rdx), %rsi
```

Arithmetic Example

```
long arith(long x, long y, long z)
{
    long t1 = x + y;
    long t2 = z + t1;
    long t3 = x + 4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}
```

```
arith:
    leaq    (%rdi,%rsi), %rax
    addq   %rdx, %rax
    leaq   (%rsi,%rsi,2), %rdx
    salq   $4, %rdx
    leaq   4(%rdi,%rdx), %rcx
    imulq  %rcx, %rax
    ret
```

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rdx	3 rd argument (z)

- ❖ Interesting Instructions
 - leaq: “address” computation
 - salq: shift
 - imulq: multiplication
 - Only used once!

Arithmetic Example

```

long arith(long x, long y, long z)
{
    long t1 = x + y;
    long t2 = z + t1;
    long t3 = x + 4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}

```

Register	Use(s)
%rdi	x
%rsi	y
%rdx	z, t4
%rax	t1, t2, rval
%rcx	t5

```

arith:
    leaq    (%rdi,%rsi), %rax    # rax/t1    = x + y
    addq   %rdx, %rax          # rax/t2    = t1 + z
    leaq   (%rsi,%rsi,2), %rdx  # rdx       = 3 * y
    salq   $4, %rdx           # rdx/t4    = (3*y) * 16
    leaq   4(%rdi,%rdx), %rcx   # rcx/t5    = x + t4 + 4
    imulq  %rcx, %rax          # rax/rval  = t5 * t2
    ret

```

Control Flow

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rax	return value

```
long max(long x, long y)
{
    long max;
    if (x > y) {
        max = x;
    } else {
        max = y;
    }
    return max;
}
```

```
max:
    ???
    movq    %rdi, %rax
    ???
    ???
    movq    %rsi, %rax
    ???
    ret
```

Control Flow

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rax	return value

```
long max(long x, long y)
{
    long max;
    if (x > y) {
        max = x;
    } else {
        max = y;
    }
    return max;
}
```

Conditional jump

Unconditional jump

```
max:
    if x <= y then jump to else
    movq    %rdi, %rax
    jump to done
else:
    movq    %rsi, %rax
done:
    ret
```

Conditionals and Control Flow

- ❖ Conditional branch/*jump*
 - Jump to somewhere else if some *condition* is true, otherwise execute next instruction
- ❖ Unconditional branch/*jump*
 - *Always* jump when you get to this instruction
- ❖ Together, they can implement most control flow constructs in high-level languages:
 - **if** (*condition*) **then** {...} **else** {...}
 - **while** (*condition*) {...}
 - **do** {...} **while** (*condition*)
 - **for** (*initialization*; *condition*; *iterative*) {...}
 - **switch** {...}

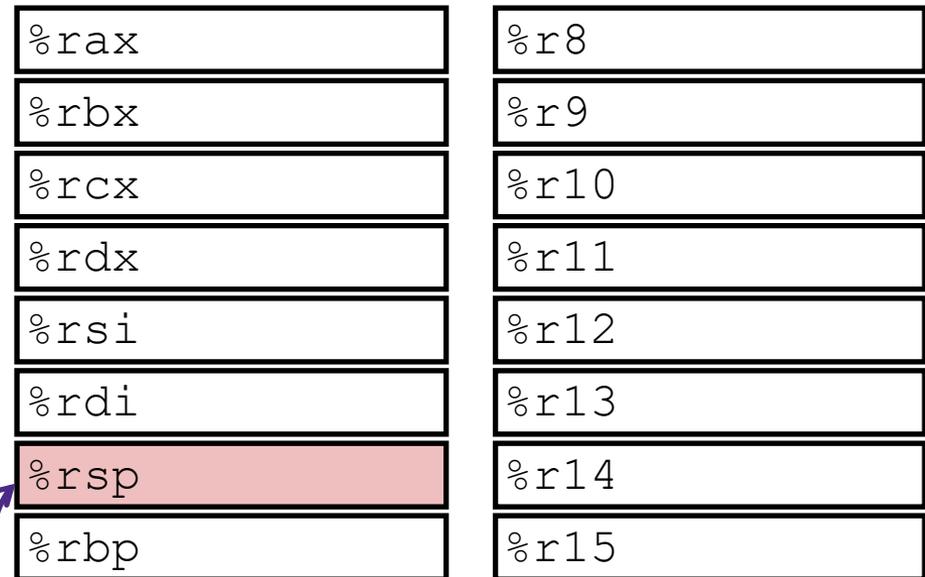

x86 Control Flow

- ❖ **Condition codes**
- ❖ **Conditional and unconditional branches**
- ❖ **Loops**
- ❖ **Switches**

Processor State (x86-64, partial)

- ❖ Information about currently executing program
 - Temporary data (`%rax`, ...)
 - Location of runtime stack (`%rsp`)
 - Location of current code control point (`%rip`, ...)
 - Status of recent tests (**CF**, **ZF**, **SF**, **OF**)
 - Single bit registers:

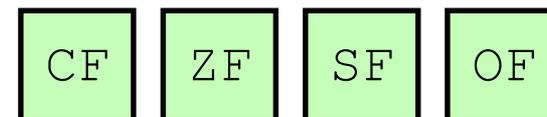

Registers

current top of the Stack

Program Counter
(instruction pointer)

Condition Codes

Condition Codes (Implicit Setting)

- ❖ *Implicitly* set by **arithmetic** operations
 - (think of it as side effects)
 - Example: **addq** src, dst \leftrightarrow r = d+s
 - **CF=1** if carry out from MSB (*unsigned* overflow)
 - **ZF=1** if r==0
 - **SF=1** if r<0 (if MSB is 1)
 - **OF=1** if *signed* overflow
(s>0 && d>0 && r<0) || (s<0 && d<0 && r>=0)
 - **Not set by lea instruction (beware!)**

Condition Codes (Explicit Setting: Compare)

❖ Explicitly set by **Compare** instruction

- `cmpq src1, src2`
- `cmpq a, b` sets flags based on $b-a$, but doesn't store
- **CF=1** if carry out from MSB (good for *unsigned* comparison)
- **ZF=1** if $a==b$
- **SF=1** if $(b-a) < 0$ (if MSB is 1)
- **OF=1** if *signed* overflow
 $(a > 0 \ \&\& \ b < 0 \ \&\& \ (b-a) > 0) \ ||$
 $(a < 0 \ \&\& \ b > 0 \ \&\& \ (b-a) < 0)$

Condition Codes (Explicit Setting: Test)

❖ *Explicitly* set by **Test** instruction

- **testq** src2, src1
- **testq** a, b sets flags based on a&b, but doesn't store
 - Useful to have one of the operands be a *mask*
- Can't have carry out (**CF**) or overflow (**OF**)
- **ZF=1** if $a \& b == 0$
- **SF=1** if $a \& b < 0$ (signed)

Example Condition Code Setting

- ❖ Assuming that `%a1 = 0x80` and `%b1 = 0x81`, which flags (CF, ZF, SF, OF) are set when we execute `cmpb %a1, %b1`?

Using Condition Codes: Jumping

❖ j^* Instructions

- Jumps to **target** (an address) based on condition codes

Instruction	Condition	Description
<code>jmp target</code>	1	Unconditional
<code>je target</code>	ZF	Equal / Zero
<code>jne target</code>	\sim ZF	Not Equal / Not Zero
<code>js target</code>	SF	Negative
<code>jns target</code>	\sim SF	Nonnegative
<code>jg target</code>	$\sim (SF \wedge OF) \ \& \ \sim ZF$	Greater (Signed)
<code>jge target</code>	$\sim (SF \wedge OF)$	Greater or Equal (Signed)
<code>j1 target</code>	$(SF \wedge OF)$	Less (Signed)
<code>jle target</code>	$(SF \wedge OF) \ \ ZF$	Less or Equal (Signed)
<code>ja target</code>	$\sim CF \ \& \ \sim ZF$	Above (unsigned ">")
<code>jb target</code>	CF	Below (unsigned "<")

Using Condition Codes: Setting

❖ `set*` Instructions

- Set low-order byte of `dst` to 0 or 1 based on condition codes
- Does not alter remaining 7 bytes

Instruction	Condition	Description
<code>sete dst</code>	ZF	Equal / Zero
<code>setne dst</code>	\sim ZF	Not Equal / Not Zero
<code>sets dst</code>	SF	Negative
<code>setns dst</code>	\sim SF	Nonnegative
<code>setg dst</code>	$\sim (SF \wedge OF) \ \& \ \sim ZF$	Greater (Signed)
<code>setge dst</code>	$\sim (SF \wedge OF)$	Greater or Equal (Signed)
<code>setl dst</code>	$(SF \wedge OF)$	Less (Signed)
<code>setle dst</code>	$(SF \wedge OF) \ \ ZF$	Less or Equal (Signed)
<code>seta dst</code>	$\sim CF \ \& \ \sim ZF$	Above (unsigned ">")
<code>setb dst</code>	CF	Below (unsigned "<")

Reading Condition Codes

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rax	return value

❖ set* Instructions

- Set a low-order byte to 0 or 1 based on condition codes
- Operand is byte register (e.g., %al) or a byte in memory
- Do not alter remaining bytes in register
 - Typically use `movzbl` (zero-extended `mov`) to finish job

```
int gt(long x, long y)
{
    return x > y;
}
```

```
cmpq    %rsi, %rdi    #
setg    %al           #
movzbl  %al, %eax     #
ret
```

Reading Condition Codes

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rax	return value

❖ set* Instructions

- Set a low-order byte to 0 or 1 based on condition codes
- Operand is byte register (e.g., %al) or a byte in memory
- Do not alter remaining bytes in register
 - Typically use `movzbl` (zero-extended `mov`) to finish job

```
int gt(long x, long y)
{
    return x > y;
}
```

```
cmpq    %rsi, %rdi    # Compare x:y
setg    %al           # Set when >
movzbl  %al, %eax     # Zero rest of %rax
ret
```

Aside: movz and movs

`movz __ src, regDest` # Move with zero extension

`movs __ src, regDest` # Move with sign extension

- Copy from a *smaller* source value to a *larger* destination
- Source can be memory or register; Destination *must* be a register
- Fill remaining bits of dest with **zero** (`movz`) or **sign bit** (`movs`)

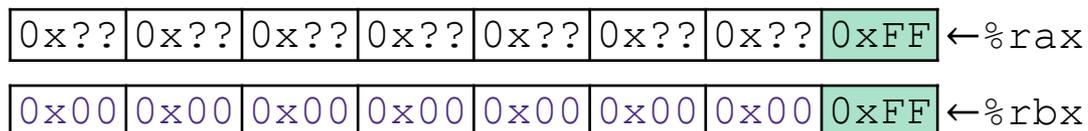

`movzSD` / `movsSD`:

S – size of source (**b** = 1 byte, **w** = 2)

D – size of dest (**w** = 2 bytes, **l** = 4, **q** = 8)

Example:

`movzbq %al, %rbx`

Aside: movz and movs

`movz __ src, regDest` # Move with zero extension

`movs __ src, regDest` # Move with sign extension

- Copy from a *smaller* source value to a *larger* destination
- Source can be memory or register; Destination *must* be a register
- Fill remaining bits of dest with **zero** (`movz`) or **sign bit** (`movs`)

`movzSD` / `movsSD`:

S – size of source (**b** = 1 byte, **w** = 2)

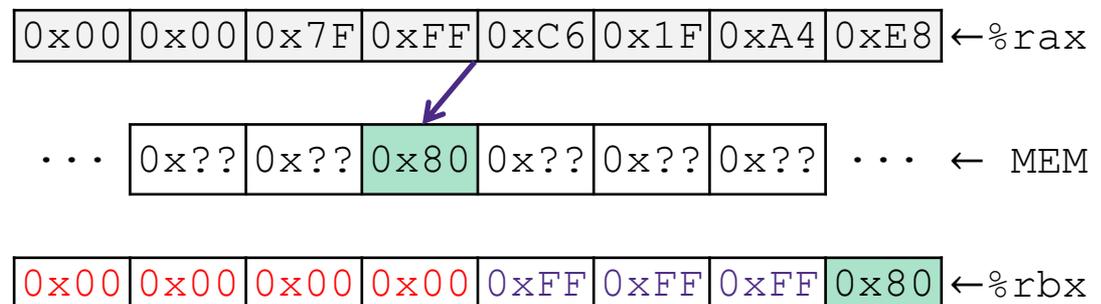

D – size of dest (**w** = 2 bytes, **l** = 4, **q** = 8)

Note: In x86-64, any instruction that generates a 32-bit (long word) value for a register also sets the high-order portion of the register to 0. Good example on p. 184 in the textbook.

Example:

`movsbl (%rax), %ebx`

Copy 1 byte from memory into 8-byte register & sign extend it

Summary

- ❖ Control flow in x86 determined by status of Condition Codes
 - Showed **C**arry, **Z**ero, **S**ign, and **O**verflow, though others exist
 - Set flags with arithmetic instructions (implicit) or Compare and Test (explicit)
 - Set instructions read out flag values
 - Jump instructions use flag values to determine next instruction to execute
