WHY I TRY NOT TO BE
PEDANTIC ABOUT CONDITIONALS.

<http://xkcd.com/1652/>

Relevant Course Information

- ❖ hw8 due TONIGHT (4/18) @ 11:59 pm
- ❖ Lab 1b, due TONIGHT, Monday 4/18 @ 11:59 pm
 - Submit `aisle_manager.c`, `store_client.c`, and `lab1Bsynthesis.txt`
 - Submissions that fail the autograder get a **ZERO**
 - No excuses – make full use of tools & Gradescope's interface
- ❖ Lab 2 (x86-64) due next Friday (4/29)
 - Learn to read x86-64 assembly and use GDB

Move extension: movz and movs

`movz__ src, regDest` # Move with zero extension
`movs__ src, regDest` # Move with sign extension

Handwritten note: 2 width specifiers: b, w, l, q (1, 2, 4, 8 bytes)

- Copy from a *smaller* source value to a *larger* destination
- Source can be memory or register; Destination *must* be a register
- Fill remaining bits of dest with **zero** (`movz`) or **sign bit** (`movs`)

`movzSD` / `movsSD`:

S – size of source (**b** = 1 byte, **w** = 2)

D – size of dest (**w** = 2 bytes, **l** = 4, **q** = 8)

Example:

`movzbq %al, %rbx`

Handwritten notes: "Zero-extend" with arrow pointing to the instruction; "1 byte" with arrow pointing to %al; "8 bytes" with arrow pointing to %rbx.

Move extension: `movz` and `movs`

`movz __ src, regDest` # Move with zero extension

`movs __ src, regDest` # Move with sign extension

- Copy from a *smaller* source value to a *larger* destination
- Source can be memory or register; Destination *must* be a register
- Fill remaining bits of dest with **zero** (`movz`) or **sign bit** (`movs`)

`movzSD` / `movsSD`:

S – size of source (**b** = 1 byte, **w** = 2)

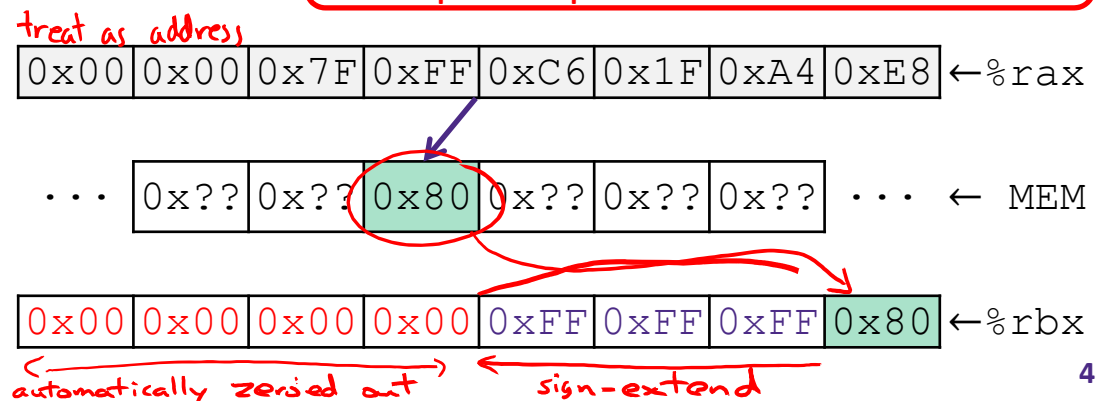

D – size of dest (**w** = 2 bytes, **l** = 4, **q** = 8)

Note: In x86-64, any instruction that generates a 32-bit (long word) value for a register also sets the high-order portion of the register to 0. Good example on p. 184 in the textbook.

Example: ^{1 byte}

`movsbl (%rax), %ebx`
^{sign-extend} ^{4 bytes}

Copy 1 byte from memory into 8-byte register & sign extend it

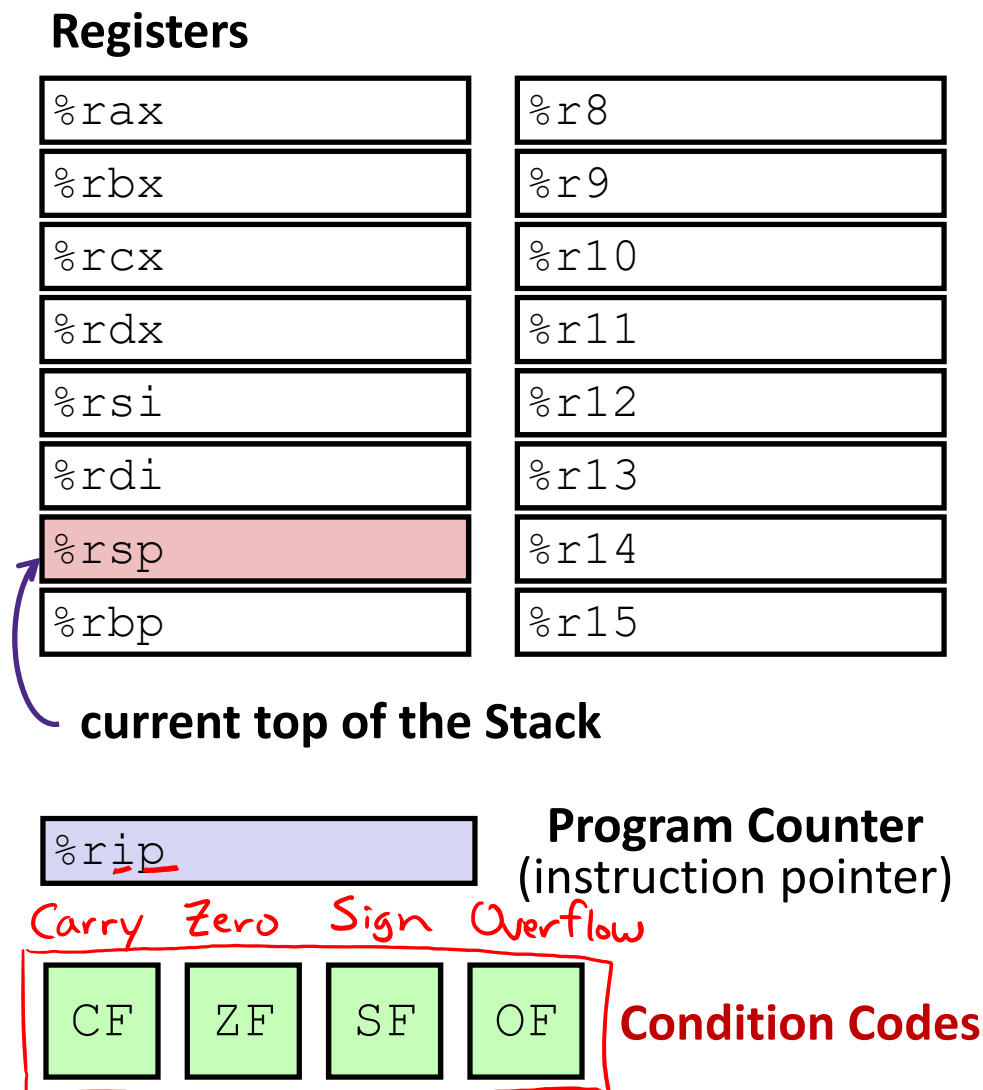

x86 Control Flow

- ❖ Condition codes
- ❖ Conditional and unconditional branches
- ❖ Loops
- ❖ Switches

Processor State (x86-64, partial)

- ❖ Information about currently executing program
 - Temporary data (`%rax`, ...)
 - Location of runtime stack (`%rsp`)
 - Location of current code control point (`%rip`, ...)
 - Status of recent tests (**CF**, **ZF**, **SF**, **OF**) "flags"
 - Single bit registers:

Condition Codes (Implicit Setting)

❖ *Implicitly* set by arithmetic operations

■ (think of it as side effects)

■ Example: **addq** src, dst \leftrightarrow r = d+s

add %eax, %eax

%eax
0b 10... 0
+ 0b 10... 0

1 00... 00

■ **CF=1** if carry out from MSB (*unsigned* overflow)

CF = 1

■ **ZF=1** if r==0

ZF = 1

■ **SF=1** if r<0 (if MSB is 1)

SF = 0

■ **OF=1** if *signed* overflow

OF = 1

(s>0 && d>0 && r<0) || (s<0 && d<0 && r>=0)

■ Not set by leaq instruction (beware!)

↑ signs don't match!

CF	Carry Flag	ZF	Zero Flag	SF	Sign Flag	OF	Overflow Flag
-----------	------------	-----------	-----------	-----------	-----------	-----------	---------------

Condition Codes (Explicit Setting: Compare)

❖ Explicitly set by **Compare** instruction

- `cmpq src1, src2` like `subq a, b` → $b - a$
- `cmpq a, b` sets flags based on $b - a$, but doesn't store

- **CF=1** if carry out from MSB (good for *unsigned* comparison)

- **ZF=1** if $a == b$ ($b - a == 0$)

- **SF=1** if $(b - a) < 0$ (if MSB is 1)

- **OF=1** if *signed* overflow

$(a > 0 \ \&\& \ b < 0 \ \&\& \ (b - a) > 0) \ ||$

$(a < 0 \ \&\& \ b > 0 \ \&\& \ (b - a) < 0)$

Condition Codes (Explicit Setting: Test)

❖ Explicitly set by **Test** instruction

- **testq** src2, src1 *like andq a, b*
- **testq** a, b sets flags based on a&b, but doesn't store
 - Useful to have one of the operands be a *mask*
- Can't have carry out (**CF**⁰) or overflow (**OF**⁰)
- **ZF=1** if a&b==0
- **SF=1** if a&b<0 (signed)

Example Condition Code Setting

- Assuming that `%a1 = 0x80` and `%b1 = 0x81`, which flags (CF, ZF, SF, OF) are set when we execute `cmpb %a1, %b1`? \rightarrow computes $\%b1 - \%a1 = \%b1 + \sim \%a1 + 1$
 $\sim \%a1 = \sim 0x80 = 0x7F$

Using Condition Codes: Jumping

❖ j* Instructions

- Jumps to **target** (an address) based on condition codes

don't worry about the details

(always compared to 0)

Instruction	Condition	Description
<code>jmp target</code>	1	Unconditional
<code><u>j</u>e target</code>	ZF	Equal / Zero
<code><u>j</u>ne target</code>	~ZF	Not Equal / Not Zero
<code><u>j</u>s target</code>	SF	Negative
<code><u>j</u>ns target</code>	~SF	Nonnegative
<code><u>j</u>g target</code>	~ (SF^OF) & ~ZF	Greater (Signed)
<code><u>j</u>ge target</code>	~ (SF^OF)	Greater or Equal (Signed)
<code><u>j</u>l target</code>	(SF^OF)	Less (Signed)
<code><u>j</u>le target</code>	(SF^OF) ZF	Less or Equal (Signed)
<code><u>j</u>a target</code>	~CF & ~ZF	Above (unsigned ">")
<code><u>j</u>b target</code>	CF	Below (unsigned "<")

Using Condition Codes: Setting

❖ set* Instructions

- Set low-order byte of `dst` to 0 or 1 based on condition codes
- Does not alter remaining 7 bytes

False → 0b 0000 0000 = 0x 00
 True → 0b 0000 0001 = 0x 01

Same instruction suffixes as j* instructions!

Instruction	Condition	Description
<code>sete dst</code>	ZF	Equal / Zero
<code>setne dst</code>	~ZF	Not Equal / Not Zero
<code>sets dst</code>	SF	Negative
<code>setns dst</code>	~SF	Nonnegative
<code>setg dst</code>	~(SF^OF) & ~ZF	Greater (Signed)
<code>setge dst</code>	~(SF^OF)	Greater or Equal (Signed)
<code>setl dst</code>	(SF^OF)	Less (Signed)
<code>setle dst</code>	(SF^OF) ZF	Less or Equal (Signed)
<code>seta dst</code>	~CF & ~ZF	Above (unsigned ">")
<code>setb dst</code>	CF	Below (unsigned "<")

Reminder: x86-64 Integer Registers

❖ Accessing the low-order byte:

Reading Condition Codes

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rax	return value

❖ set* Instructions

- Set a low-order byte to 0 or 1 based on condition codes
- Operand is byte register (e.g., %al) or a byte in memory
- Do not alter remaining bytes in register
 - Typically use movzbl (zero-extended mov) to finish job

```

int gt(long x, long y)
{
    return x > y;
}
    
```

$x - y > 0$
 $x > y$

```

cmpq    %rsi, %rdi    # set flags based on x-y
setg    %al           # %al = (x > y)
movzbl  %al, %eax     # %rax = (x > y)
ret
    
```

zero-extend →

← lowest byte
 ← whole register

Reading Condition Codes

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rax	return value

❖ set* Instructions

- Set a low-order byte to 0 or 1 based on condition codes
- Operand is byte register (e.g., %al) or a byte in memory
- Do not alter remaining bytes in register
 - Typically use `movzbl` (zero-extended `mov`) to finish job

```
int gt(long x, long y)
{
    return x > y;
}
```

```
cmpq    %rsi, %rdi    # Compare x:y
setg    %al           # Set when >
movzbl  %al, %eax     # Zero rest of %rax
ret
```

Reading Review

- ❖ Terminology:
 - Label, jump target
 - Program counter
 - Jump table, indirect jump

Choosing instructions for conditionals

- ❖ All arithmetic instructions set condition flags based on result of operation (op)
 - Conditionals are comparisons against 0
- ❖ Come in instruction *pairs*

Pick one!

```

addq 5, (p)
je:    *p+5 == 0
jne:   *p+5 != 0
jg:    *p+5 > 0
jl:    *p+5 < 0
    
```

Pick one!

```

orq a, b
je:    b|a == 0
jne:   b|a != 0
jg:    b|a > 0
jl:    b|a < 0
    
```

		(op) s, d
je	"Equal"	d (op) s == 0
jne	"Not equal"	d (op) s != 0
js	"Sign" (negative)	d (op) s < 0
jns	(non-negative)	d (op) s >= 0
jg	"Greater"	d (op) s > 0
jge	"Greater or equal"	d (op) s >= 0
jl	"Less"	d (op) s < 0
jle	"Less or equal"	d (op) s <= 0
ja	"Above" (unsigned >)	d (op) s > 0U
jb	"Below" (unsigned <)	d (op) s < 0U

Choosing instructions for conditionals

- ❖ Reminder: `cmp` is like `sub`, `test` is like `and`
 - Result is not stored anywhere

		<code>cmp a, b</code>	<code>test a, b</code>
je	"Equal"	<code>b == a</code>	<code>b&a == 0</code>
jne	"Not equal"	<code>b != a</code>	<code>b&a != 0</code>
js	"Sign" (negative)	<code>b-a < 0</code>	<code>b&a < 0</code>
jns	(non-negative)	<code>b-a >= 0</code>	<code>b&a >= 0</code>
jg	"Greater"	<code>b > a</code>	<code>b&a > 0</code>
jge	"Greater or equal"	<code>b >= a</code>	<code>b&a >= 0</code>
jl	"Less"	<code>b < a</code>	<code>b&a < 0</code>
jle	"Less or equal"	<code>b <= a</code>	<code>b&a <= 0</code>
ja	"Above" (unsigned >)	<code>b-a > 0U</code>	<code>b&a > 0U</code>
jb	"Below" (unsigned <)	<code>b-a < 0U</code>	<code>b&a < 0U</code>

```

cmpq 5, (p)
je:   *p == 5
jne:  *p != 5
jg:   *p > 5
jl:   *p < 5
    
```

```

testq a, a
je:   a == 0
jne:  a != 0
jg:   a > 0
jl:   a < 0
    
```

```

testb a, 0x1
je:   aLSB == 0
jne:  aLSB == 1
    
```

Choosing instructions for conditionals

		① <u>cmp a, b</u>	test a, b
je	"Equal"	b == a	b&a == 0
jne	"Not equal"	b != a	b&a != 0
js	"Sign" (negative)	b-a < 0	b&a < 0
jns	(non-negative)	b-a >= 0	b&a >= 0
jg	"Greater"	b > a	b&a > 0
② jge	"Greater or equal"	<u>b >= a</u>	b&a >= 0
jl	"Less"	b < a	b&a < 0
jle	"Less or equal"	b <= a	b&a <= 0
ja	"Above" (unsigned >)	b > a	b&a > 0U
jb	"Below" (unsigned <)	b < a	b&a < 0U

Register	Use(s)
%rdi	argument x
%rsi	argument y
%rax	return value

```

if (x < 3) {
    return 1;
}
return 2;
    
```

Handwritten notes: **rdi** above `x`; *do this if x ≥ 3* with an arrow pointing to the `return 2;` line.

```

cmpq $3, %rdi
jge T2
T1: # x < 3:
    movq $1, %rax
    ret
T2: # !(x < 3):
    movq $2, %rax
    ret
    
```

Handwritten notes: $x - 3 \geq 0$ and $x \geq 3$ written in red next to the assembly code.

Practice Question 1

Register	Use(s)
%rdi	1 st argument (x)
%rsi	2 nd argument (y)
%rax	return value

```
long absdiff(long x, long y)
{
    long result;
    if (x > y)
        result = x-y;
    else
        result = y-x;
    return result;
}
```

Handwritten notes: A red circle around 'x > y' in the if statement. A red arrow points from the 'else' branch to the handwritten text 'x ≤ y'.

- A.** `cmpq %rsi, %rdi`
`jle .L4` *Handwritten: y, x, x-y ≤ 0*
- B.** `cmpq %rsi, %rdi`
`jg .L4` *Handwritten: x, x-y > 0*
- ~~**C.** `testq %rsi, %rdi`
`jle .L4` *Handwritten: x & y*~~
- ~~**D.** `testq %rsi, %rdi`
`jg .L4` *Handwritten: x & y*~~
- E.** We're lost...

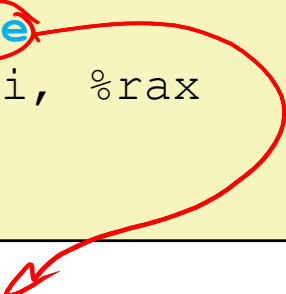

```
absdiff:
    _____
    _____
                                     # x > y:
    movq    %rdi, %rax
    subq    %rsi, %rax
    ret
.L4:
    movq    %rsi, %rax
    subq    %rdi, %rax
    ret
                                     # x <= y:
```

Handwritten notes: A red circle around the label '.L4:'. A red circle around the comment '# x <= y:'.

Labels

```
swap:  
    movq    (%rdi), %rax  
    movq    (%rsi), %rdx  
    movq    %rdx, (%rdi)  
    movq    %rax, (%rsi)  
    ret
```

```
max:  
    movq    %rdi, %rax  
    cmpq    %rsi, %rdi  
    jg     done  
    movq    %rsi, %rax  
done:  
    ret
```

- ❖ A jump changes the program counter (%rip)
 - %rip tells the CPU the *address* of the next instruction to execute
- ❖ **Labels** give us a way to refer to a specific instruction in our assembly/machine code
 - Associated with the *next* instruction found in the assembly code (ignores whitespace)
 - Each *use* of the label will eventually be replaced with something that indicates the final address of the instruction that it is associated with

x86 Control Flow

- ❖ Condition codes
- ❖ Conditional and unconditional branches
- ❖ **Loops**
- ❖ Switches

Expressing with Goto Code

```

long absdiff(long x, long y)
{
    long result;
    if (x > y)
        result = x-y;
    else
        result = y-x;
    return result;
}

```

```

long absdiff_j(long x, long y)
{
    long result;
    int ntest = (x <= y);
    if (ntest) goto Else;
    result = x-y;
    goto Done;
Else:
    result = y-x;
Done:
    return result;
}

```

conditional jump

unconditional jump → goto Done;

Else: →

Done: →

labels (addresses)

cmp

jle

jmp

- ❖ C allows `goto` as means of transferring control (`jump`)
 - Closer to assembly programming style
 - Generally considered bad coding style

Compiling Loops

C/Java code:

```
while ( sum Test != 0 ) {  
    <loop body>  
}
```

Assembly code:

```
loopTop:  testq %rax, %rax } !Test  
          je     loopDone  
          <loop body code>  
          jmp    loopTop  
loopDone:
```

- ❖ Other loops compiled similarly
 - Will show variations and complications in coming slides, but may skip a few examples in the interest of time
- ❖ Most important to consider:
 - When should conditionals be evaluated? (*while* vs. *do-while*)
 - How much jumping is involved?

Compiling Loops

all jump instructions
update the program counter (rip)

While Loop:

```
C: while ( sum Test != 0 ) {
    <loop body>
}
```

x86-64:

```
loopTop:    testq %rax, %rax } ~Test
            je     loopDone
            <loop body code>
            jmp    loopTop
loopDone:
```

sum == 0

Do-while Loop:

```
C: do {
    <loop body>
} while ( sum Test != 0 )
```

x86-64:

```
loopTop:
    <loop body code>
    testq %rax, %rax } Test
    jne   loopTop
loopDone:
```

While Loop (ver. 2):

```
C: while ( sum Test != 0 ) {
    <loop body>
}
```

x86-64:

```
loopTop:    testq %rax, %rax } ~Test
            je     loopDone
            <loop body code>
            testq %rax, %rax } Test
            jne   loopTop
loopDone:
```

do-while loop

For-Loop → While-Loop

For-Loop:

```
for (Init; Test; Update) {  
    Body  
}
```

While-Loop Version:

```
Init;  
while (Test) {  
    Body  
    Update;  
}
```

Caveat: C and Java have `break` and `continue`

- Conversion works fine for `break`
 - Jump to same label as loop exit condition
- But not `continue`: would skip doing *Update*, which it should do with for-loops
 - Introduce new label at *Update*

Practice Question 2

- ❖ The following is assembly code for a for-loop; identify the corresponding parts (Init, Test, Update)
 - $i \rightarrow \%eax$, $x \rightarrow \%rdi$, $y \rightarrow \%esi$

```

Line
1      movl    $0, %eax      ← Init
2      .L2:   cmpl    %esi, %eax  } !Test → i - y >= 0
3      jge    .L4
4      movslq %eax, %rdx
5      leaq   (%rdi,%rdx,4), %rcx
6      movl   (%rcx), %edx
7      addl   $1, %edx
8      movl   %edx, (%rcx)
9      addl   $1, %eax      ← Update
10     jmp    .L2
11     .L4:
    
```

Handwritten annotations:

- Red arrow labeled "exit" from line 3 to line 11.
- Red arrow labeled "loop" from line 10 to line 2.
- Red text: $i - y \geq 0$ and $i \geq y$ with arrows pointing to the test instruction.

for (int i = 0 ; i < y ; i++) {

Init Test Update

Summary

- ❖ Control flow in x86 determined by Condition Codes
 - Showed **C**arry, **Z**ero, **S**ign, and **O**verflow, though others exist
 - Set flags with arithmetic instructions (implicit) or Compare and Test (explicit)
 - Set instructions read out flag values
 - Jump instructions use flag values to determine next instruction to execute
 - Most control flow constructs (*e.g.*, if-else, for-loop, while-loop) can be implemented in assembly using combinations of conditional and unconditional jumps
