

# x86-64 Programming III

CSE 351 Spring 2022

## Instructor:

Ruth Anderson

## Teaching Assistants:

Melissa Birchfield

Jacob Christy

Alena Dickmann

Kyrie Dowling

Ellis Haker

Maggie Jiang

Diya Joy

Anirudh Kumar

Jim Limprasert

Armin Magness

Hamsa Shankar

Dara Stotland

Jeffery Tian

Assaf Vayner

Tom Wu

Angela Xu

Effie Zheng

WHY I TRY NOT TO BE  
PEDANTIC ABOUT CONDITIONALS.

<http://xkcd.com/1652/>

# Relevant Course Information

- ❖ hw8 due TONIGHT (4/18) @ 11:59 pm
- ❖ Lab 1b, due TONIGHT, Monday 4/18 @ 11:59 pm
  - Submit `aisle_manager.c`, `store_client.c`, and `lab1Bsynthesis.txt`
  - Submissions that fail the autograder get a **ZERO**
    - No excuses – make full use of tools & Gradescope's interface
- ❖ Lab 2 (x86-64) due next Friday (4/29)
  - Learn to read x86-64 assembly and use GDB

# Move extension: `movz` and `movs`

`movz __ src, regDest`      # Move with zero extension

`movs __ src, regDest`      # Move with sign extension

- Copy from a *smaller* source value to a *larger* destination
- Source can be memory or register; Destination *must* be a register
- Fill remaining bits of dest with **zero** (`movz`) or **sign bit** (`movs`)

`movzSD` / `movsSD`:

S – size of source (**b** = 1 byte, **w** = 2)

D – size of dest (**w** = 2 bytes, **l** = 4, **q** = 8)

Example:

`movzbq %al, %rbx`

# Move extension: `movz` and `movs`

`movz __ src, regDest` # Move with zero extension

`movs __ src, regDest` # Move with sign extension

- Copy from a *smaller* source value to a *larger* destination
- Source can be memory or register; Destination *must* be a register
- Fill remaining bits of dest with **zero** (`movz`) or **sign bit** (`movs`)

`movzSD` / `movsSD`:

S – size of source (**b** = 1 byte, **w** = 2)

D – size of dest (**w** = 2 bytes, **l** = 4, **q** = 8)

**Note:** In x86-64, any instruction that generates a 32-bit (long word) value for a register also sets the high-order portion of the register to 0. Good example on p. 184 in the textbook.

Example:

`movsbl (%rax), %ebx`

Copy 1 byte from memory into 8-byte register & sign extend it

# x86 Control Flow

- ❖ **Condition codes**
- ❖ **Conditional and unconditional branches**
- ❖ **Loops**
- ❖ **Switches**

# Processor State (x86-64, partial)

- ❖ Information about currently executing program
  - Temporary data ( `%rax`, ... )
  - Location of runtime stack ( `%rsp` )
  - Location of current code control point ( `%rip`, ... )
  - Status of recent tests ( **CF**, **ZF**, **SF**, **OF** )
    - Single bit registers:

## Registers

current top of the Stack

**Program Counter**  
(instruction pointer)

**Condition Codes**

# Condition Codes (Implicit Setting)

- ❖ *Implicitly* set by **arithmetic** operations
  - (think of it as side effects)
  - Example: **addq** src, dst  $\leftrightarrow$   $r = d+s$
  - **CF=1** if carry out from MSB (*unsigned* overflow)
  - **ZF=1** if  $r==0$
  - **SF=1** if  $r<0$  (if MSB is 1)
  - **OF=1** if *signed* overflow  
( $s>0 \ \&\& \ d>0 \ \&\& \ r<0$ ) || ( $s<0 \ \&\& \ d<0 \ \&\& \ r>=0$ )
  - **Not set by lea instruction (beware!)**

# Condition Codes (Explicit Setting: Compare)

## ❖ Explicitly set by **Compare** instruction

- `cmpq src1, src2`
- `cmpq a, b` sets flags based on  $b-a$ , but doesn't store
- **CF=1** if carry out from MSB (good for *unsigned* comparison)
- **ZF=1** if  $a==b$
- **SF=1** if  $(b-a) < 0$  (if MSB is 1)
- **OF=1** if *signed* overflow  
 $(a > 0 \ \&\& \ b < 0 \ \&\& \ (b-a) > 0) \ ||$   
 $(a < 0 \ \&\& \ b > 0 \ \&\& \ (b-a) < 0)$

# Condition Codes (Explicit Setting: Test)

## ❖ Explicitly set by **Test** instruction

- **testq** src2, src1
- **testq** a, b sets flags based on a&b, but doesn't store
  - Useful to have one of the operands be a *mask*
- Can't have carry out (**CF**) or overflow (**OF**)
- **ZF=1** if  $a \& b == 0$
- **SF=1** if  $a \& b < 0$  (signed)

# Example Condition Code Setting

- ❖ Assuming that `%a1 = 0x80` and `%b1 = 0x81`, which flags (CF, ZF, SF, OF) are set when we execute **`cmpb %a1, %b1`**?

# Using Condition Codes: Jumping

## ❖ $j^*$ Instructions

- Jumps to **target** (an address) based on condition codes

Instruction	Condition	Description
<code>jmp target</code>	1	Unconditional
<code>je target</code>	ZF	Equal / Zero
<code>jne target</code>	$\sim$ ZF	Not Equal / Not Zero
<code>js target</code>	SF	Negative
<code>jns target</code>	$\sim$ SF	Nonnegative
<code>jg target</code>	$\sim (SF \wedge OF) \ \& \ \sim ZF$	Greater (Signed)
<code>jge target</code>	$\sim (SF \wedge OF)$	Greater or Equal (Signed)
<code>jle target</code>	$(SF \wedge OF) \   \ ZF$	Less or Equal (Signed)
<code>ja target</code>	$\sim CF \ \& \ \sim ZF$	Above (unsigned ">")
<code>jb target</code>	CF	Below (unsigned "<")

# Using Condition Codes: Setting

## ❖ `set*` Instructions

- Set low-order byte of `dst` to 0 or 1 based on condition codes
- Does not alter remaining 7 bytes

Instruction	Condition	Description
<code>sete dst</code>	ZF	Equal / Zero
<code>setne dst</code>	$\sim$ ZF	Not Equal / Not Zero
<code>sets dst</code>	SF	Negative
<code>setns dst</code>	$\sim$ SF	Nonnegative
<code>setg dst</code>	$\sim (SF \wedge OF) \ \& \ \sim ZF$	Greater (Signed)
<code>setge dst</code>	$\sim (SF \wedge OF)$	Greater or Equal (Signed)
<code>setl dst</code>	$(SF \wedge OF)$	Less (Signed)
<code>setle dst</code>	$(SF \wedge OF) \   \ ZF$	Less or Equal (Signed)
<code>seta dst</code>	$\sim CF \ \& \ \sim ZF$	Above (unsigned ">")
<code>setb dst</code>	CF	Below (unsigned "<")

# Reminder: x86-64 Integer Registers

## ❖ Accessing the low-order byte:

<code>%rax</code>	<code>%al</code>
<code>%rbx</code>	<code>%bl</code>
<code>%rcx</code>	<code>%cl</code>
<code>%rdx</code>	<code>%dl</code>
<code>%rsi</code>	<code>%sil</code>
<code>%rdi</code>	<code>%dil</code>
<code>%rsp</code>	<code>%spl</code>
<code>%rbp</code>	<code>%bpl</code>

<code>%r8</code>	<code>%r8b</code>
<code>%r9</code>	<code>%r9b</code>
<code>%r10</code>	<code>%r10b</code>
<code>%r11</code>	<code>%r11b</code>
<code>%r12</code>	<code>%r12b</code>
<code>%r13</code>	<code>%r13b</code>
<code>%r14</code>	<code>%r14b</code>
<code>%r15</code>	<code>%r15b</code>

# Reading Condition Codes

Register	Use(s)
%rdi	1 <sup>st</sup> argument (x)
%rsi	2 <sup>nd</sup> argument (y)
%rax	return value

## ❖ set\* Instructions

- Set a low-order byte to 0 or 1 based on condition codes
- Operand is byte register (e.g., %al) or a byte in memory
- Do not alter remaining bytes in register
  - Typically use `movzbl` (zero-extended `mov`) to finish job

```
int gt(long x, long y)
{
    return x > y;
}
```

```
cmpq    %rsi, %rdi    #
setg    %al           #
movzbl  %al, %eax     #
ret
```

# Reading Condition Codes

Register	Use(s)
%rdi	1 <sup>st</sup> argument (x)
%rsi	2 <sup>nd</sup> argument (y)
%rax	return value

## ❖ set\* Instructions

- Set a low-order byte to 0 or 1 based on condition codes
- Operand is byte register (e.g., %al) or a byte in memory
- Do not alter remaining bytes in register
  - Typically use `movzbl` (zero-extended `mov`) to finish job

```
int gt(long x, long y)
{
    return x > y;
}
```

```
cmpq    %rsi, %rdi    # Compare x:y
setg    %al           # Set when >
movzbl  %al, %eax     # Zero rest of %rax
ret
```

# Reading Review

- ❖ Terminology:
  - Label, jump target
  - Program counter
  - Jump table, indirect jump

# Choosing instructions for conditionals

- ❖ All arithmetic instructions set condition flags based on result of operation (*op*)
  - Conditionals are comparisons against 0
- ❖ Come in instruction *pairs*

```

addq 5, (p)
je:   *p+5 == 0
jne:  *p+5 != 0
jg:   *p+5 > 0
jl:   *p+5 < 0

```

```

orq a, b
je:   b|a == 0
jne:  b|a != 0
jg:   b|a > 0
jl:   b|a < 0

```

		( <i>op</i> ) s, d
<b>je</b>	"Equal"	d ( <i>op</i> ) s == 0
<b>jne</b>	"Not equal"	d ( <i>op</i> ) s != 0
<b>js</b>	"Sign" (negative)	d ( <i>op</i> ) s < 0
<b>jns</b>	(non-negative)	d ( <i>op</i> ) s >= 0
<b>jg</b>	"Greater"	d ( <i>op</i> ) s > 0
<b>jge</b>	"Greater or equal"	d ( <i>op</i> ) s >= 0
<b>jl</b>	"Less"	d ( <i>op</i> ) s < 0
<b>jle</b>	"Less or equal"	d ( <i>op</i> ) s <= 0
<b>ja</b>	"Above" (unsigned >)	d ( <i>op</i> ) s > 0U
<b>jb</b>	"Below" (unsigned <)	d ( <i>op</i> ) s < 0U

# Choosing instructions for conditionals

- ❖ Reminder: `cmp` is like `sub`, `test` is like `and`
  - Result is not stored anywhere

		<code>cmp a,b</code>	<code>test a,b</code>
<b>je</b>	“Equal”	$b == a$	$b \& a == 0$
<b>jne</b>	“Not equal”	$b != a$	$b \& a != 0$
<b>js</b>	“Sign” (negative)	$b - a < 0$	$b \& a < 0$
<b>jns</b>	(non-negative)	$b - a \geq 0$	$b \& a \geq 0$
<b>jg</b>	“Greater”	$b > a$	$b \& a > 0$
<b>jge</b>	“Greater or equal”	$b \geq a$	$b \& a \geq 0$
<b>jl</b>	“Less”	$b < a$	$b \& a < 0$
<b>jle</b>	“Less or equal”	$b \leq a$	$b \& a \leq 0$
<b>ja</b>	“Above” (unsigned >)	$b - a > 0U$	$b \& a > 0U$
<b>jb</b>	“Below” (unsigned <)	$b - a < 0U$	$b \& a < 0U$

```

cmpq 5, (p)
je:   *p == 5
jne:  *p != 5
jg:   *p > 5
jl:   *p < 5

```

```

testq a, a
je:   a == 0
jne:  a != 0
jg:   a > 0
jl:   a < 0

```

```

testb a, 0x1
je:   aLSB == 0
jne:  aLSB == 1

```

# Choosing instructions for conditionals

		<b>cmp a,b</b>	<b>test a,b</b>
<b>je</b>	“Equal”	$b == a$	$b \& a == 0$
<b>jne</b>	“Not equal”	$b != a$	$b \& a != 0$
<b>js</b>	“Sign” (negative)	$b - a < 0$	$b \& a < 0$
<b>jns</b>	(non-negative)	$b - a \geq 0$	$b \& a \geq 0$
<b>jg</b>	“Greater”	$b > a$	$b \& a > 0$
<b>jge</b>	“Greater or equal”	$b \geq a$	$b \& a \geq 0$
<b>jl</b>	“Less”	$b < a$	$b \& a < 0$
<b>jle</b>	“Less or equal”	$b \leq a$	$b \& a \leq 0$
<b>ja</b>	“Above” (unsigned >)	$b > a$	$b \& a > 0U$
<b>jb</b>	“Below” (unsigned <)	$b < a$	$b \& a < 0U$

Register	Use(s)
<code>%rdi</code>	argument $x$
<code>%rsi</code>	argument $y$
<code>%rax</code>	return value

```

if (x < 3) {
    return 1;
}
return 2;

```

```

cmpq $3, %rdi
jge T2
T1: # x < 3:
    movq $1, %rax
    ret
T2: # !(x < 3):
    movq $2, %rax
    ret

```

# Practice Question 1

Register	Use(s)
%rdi	1 <sup>st</sup> argument (x)
%rsi	2 <sup>nd</sup> argument (y)
%rax	return value

- A. `cmpq %rsi, %rdi`  
`jle .L4`
- B. `cmpq %rsi, %rdi`  
`jg .L4`
- C. `testq %rsi, %rdi`  
`jle .L4`
- D. `testq %rsi, %rdi`  
`jg .L4`
- E. We're lost...

```
long absdiff(long x, long y)
{
    long result;
    if (x > y)
        result = x-y;
    else
        result = y-x;
    return result;
}
```

```
absdiff:
    _____
    _____
                                     # x > y:
    movq    %rdi, %rax
    subq    %rsi, %rax
    ret
.L4:                                     # x <= y:
    movq    %rsi, %rax
    subq    %rdi, %rax
    ret
```

# Labels

**swap:**

```
movq (%rdi), %rax
movq (%rsi), %rdx
movq %rdx, (%rdi)
movq %rax, (%rsi)
ret
```

**max:**

```
movq %rdi, %rax
cmpq %rsi, %rdi
jg done
movq %rsi, %rax
done:
ret
```

- ❖ A jump changes the program counter (`%rip`)
  - `%rip` tells the CPU the *address* of the next instruction to execute
- ❖ **Labels** give us a way to refer to a specific instruction in our assembly/machine code
  - Associated with the *next* instruction found in the assembly code (ignores whitespace)
  - Each *use* of the label will eventually be replaced with something that indicates the final address of the instruction that it is associated with

# x86 Control Flow

- ❖ Condition codes
- ❖ Conditional and unconditional branches
- ❖ **Loops**
- ❖ Switches

# Expressing with Goto Code

```
long absdiff(long x, long y)
{
    long result;
    if (x > y)
        result = x-y;
    else
        result = y-x;
    return result;
}
```

```
long absdiff_j(long x, long y)
{
    long result;
    int ntest = (x <= y);
    if (ntest) goto Else;
    result = x-y;
    goto Done;
Else:
    result = y-x;
Done:
    return result;
}
```

- ❖ C allows `goto` as means of transferring control (jump)
  - Closer to assembly programming style
  - Generally considered bad coding style

# Compiling Loops

C/Java code:

```
while ( sum != 0 ) {  
    <loop body>  
}
```

Assembly code:

```
loopTop:    testq %rax, %rax  
            je      loopDone  
            <loop body code>  
            jmp     loopTop  
  
loopDone:
```

- ❖ Other loops compiled similarly
  - Will show variations and complications in coming slides, but may skip a few examples in the interest of time
- ❖ Most important to consider:
  - When should conditionals be evaluated? (*while* vs. *do-while*)
  - How much jumping is involved?

# Compiling Loops

## While Loop:

C: `while ( sum != 0 ) {  
    <loop body>  
}`

x86-64:

```
loopTop:    testq %rax, %rax
            je     loopDone
            <loop body code>
            jmp    loopTop

loopDone:
```

## Do-while Loop:

C: `do {  
    <loop body>  
} while ( sum != 0 )`

x86-64:

```
loopTop:
            <loop body code>
            testq %rax, %rax
            jne    loopTop

loopDone:
```

## While Loop (ver. 2):

C: `while ( sum != 0 ) {  
    <loop body>  
}`

x86-64:

```

            testq %rax, %rax
            je     loopDone

loopTop:
            <loop body code>
            testq %rax, %rax
            jne    loopTop

loopDone:
```

# For-Loop → While-Loop

For-Loop:

```
for (Init; Test; Update) {  
    Body  
}
```

While-Loop Version:

```
Init;  
while (Test) {  
    Body  
    Update;  
}
```

Caveat: C and Java have `break` and `continue`

- Conversion works fine for `break`
  - Jump to same label as loop exit condition
- But not `continue`: would skip doing `Update`, which it should do with for-loops
  - Introduce new label at `Update`

## Practice Question 2

- ❖ The following is assembly code for a for-loop; identify the corresponding parts (Init, Test, Update)
  - $i \rightarrow \%eax$ ,  $x \rightarrow \%rdi$ ,  $y \rightarrow \%esi$

```
.L2:  movl    $0, %eax
      cmpl   %esi, %eax
      jge   .L4
      movslq %eax, %rdx
      leaq  (%rdi,%rdx,4), %rcx
      movl  (%rcx), %edx
      addl  $1, %edx
      movl  %edx, (%rcx)
      addl  $1, %eax
      jmp  .L2
.L4:
```

# Summary

- ❖ Control flow in x86 determined by Condition Codes
  - Showed **C**arry, **Z**ero, **S**ign, and **O**verflow, though others exist
  - Set flags with arithmetic instructions (implicit) or Compare and Test (explicit)
  - Set instructions read out flag values
  - Jump instructions use flag values to determine next instruction to execute
  - Most control flow constructs (*e.g.*, if-else, for-loop, while-loop) can be implemented in assembly using combinations of conditional and unconditional jumps
