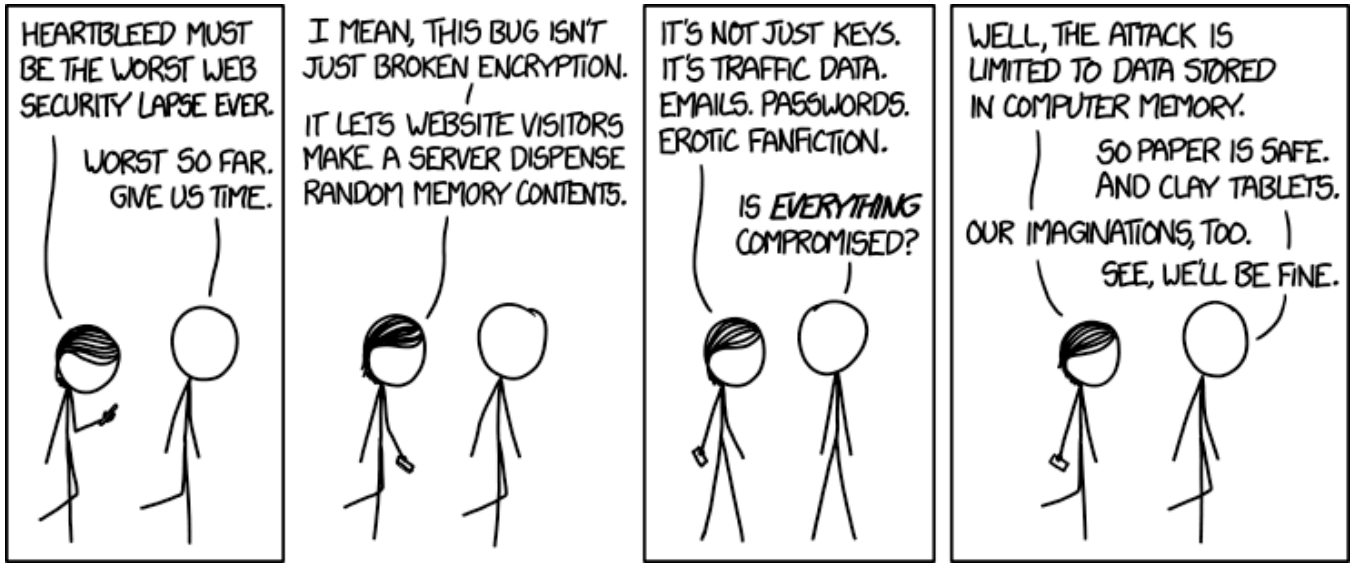
Memory & Caches I

CSE 351 Autumn 2024

Instructor:
Ruth Anderson

Teaching Assistants:
Alexandra Michael
Connie Chen
Chloe Fong
Chendur Jayavelu
Joshua Tan
Nikolas McNamee
Nahush Shrivatsa
Naama Amiel
Neela Kausik
Renee Ruan
Rubee Zhao
Samantha Dreussi
Sean Siddens
Waleed Yagoub



Alt text: I looked at some of the data dumps from vulnerable sites, and it was ... bad. I saw emails, passwords, password hints. SSL keys and session cookies. Important servers brimming with visitor IPs. Attack ships on fire off the shoulder of Orion, c-beams glittering in the dark near the Tannhäuser Gate. I should probably patch OpenSSL.

Relevant Course Information

- HW14 due TONIGHT, Wednesday (10/30) @ 11:59 pm
- No Lecture on Fri 11/01 (No HW/Reading due)
  - HW15 not due until next Monday (11/04)
  - HW16 de next Wed (11/06)
- **Midterm Exam**: See Ed Post and exams page
  - Take home, on Gradescope
  - Open: Thursday 10/31 at 5pm; Due: Saturday 11/02 at 11:59pm
  - Review in section this week (10/31)
- Lab 3 due Mon 11/11
  - Encouraged to aim for Fri 11/08, actual deadline Mon 11/11
  - You have everything you need to do the lab as of last lecture!
  - Last part of HW15 (due Mon 11/04) is useful for Lab 3

Aside: Units and Prefixes (Review)

- Here focusing on large numbers (exponents > 0)
- Note that $10^3 \approx 2^{10}$
- SI prefixes are *ambiguous* if base 10 or 2
- IEC prefixes are *unambiguously* base 2

SIZE PREFIXES (10^x for Disk, Communication; 2^x for Memory)

SI Size	Prefix	Symbol	IEC Size	Prefix	Symbol
10^3	Kilo-	K	2^{10}	Kibi-	Ki
10^6	Mega-	M	2^{20}	Mebi-	Mi
10^9	Giga-	G	2^{30}	Gibi-	Gi
10^{12}	Tera-	T	2^{40}	Tebi-	Ti
10^{15}	Peta-	P	2^{50}	Pebi-	Pi
10^{18}	Exa-	E	2^{60}	Exbi-	Ei
10^{21}	Zetta-	Z	2^{70}	Zebi-	Zi
10^{24}	Yotta-	Y	2^{80}	Yobi-	Yi

How to Remember?

- Will be given to you on Final reference sheet

- Mnemonics
  - There unfortunately isn't one well-accepted mnemonic
    - But that shouldn't stop you from trying to come with one!
  - **K**iller **M**echanical **G**iraffe **T**eaches **P**et, **E**xtinct **Z**ebra to **Y**odel
  - **K**irby **M**issed **G**anondorf **T**erribly, **P**otentially **E**xterminating **Z**elda and **Y**oshi
  - xkcd: **K**arl **M**arx **G**ave **T**he **P**roletariat **E**leven **Z**eppelins, **Y**o
    - https://xkcd.com/992/
  - Post your best on Ed Discussion!

Reading Review

- Terminology:
  - Caches: cache blocks, cache hit, cache miss
  - Principle of locality: temporal and spatial
  - Average memory access time (AMAT): hit time, miss penalty, hit rate, miss rate

Review Questions

- Convert the following to or from IEC:
  - 512 Ki-books
  - 2^{27} cats

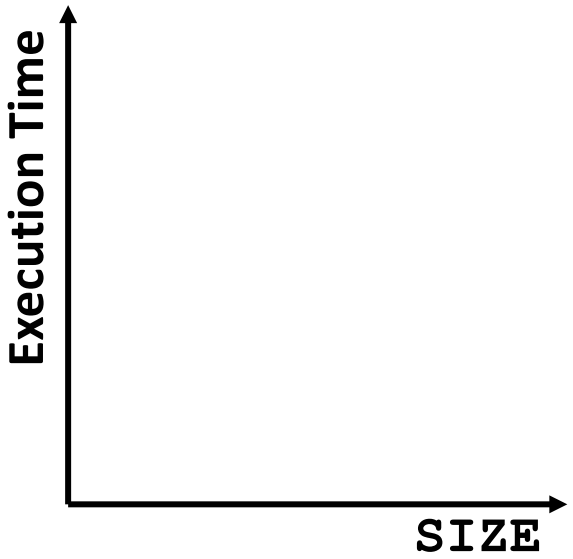
- Compute the average memory access time (AMAT) for the following system properties:
  - Hit time of 1 ns
  - Miss rate of 1%
  - Miss penalty of 100 ns

How does execution time grow with SIZE?

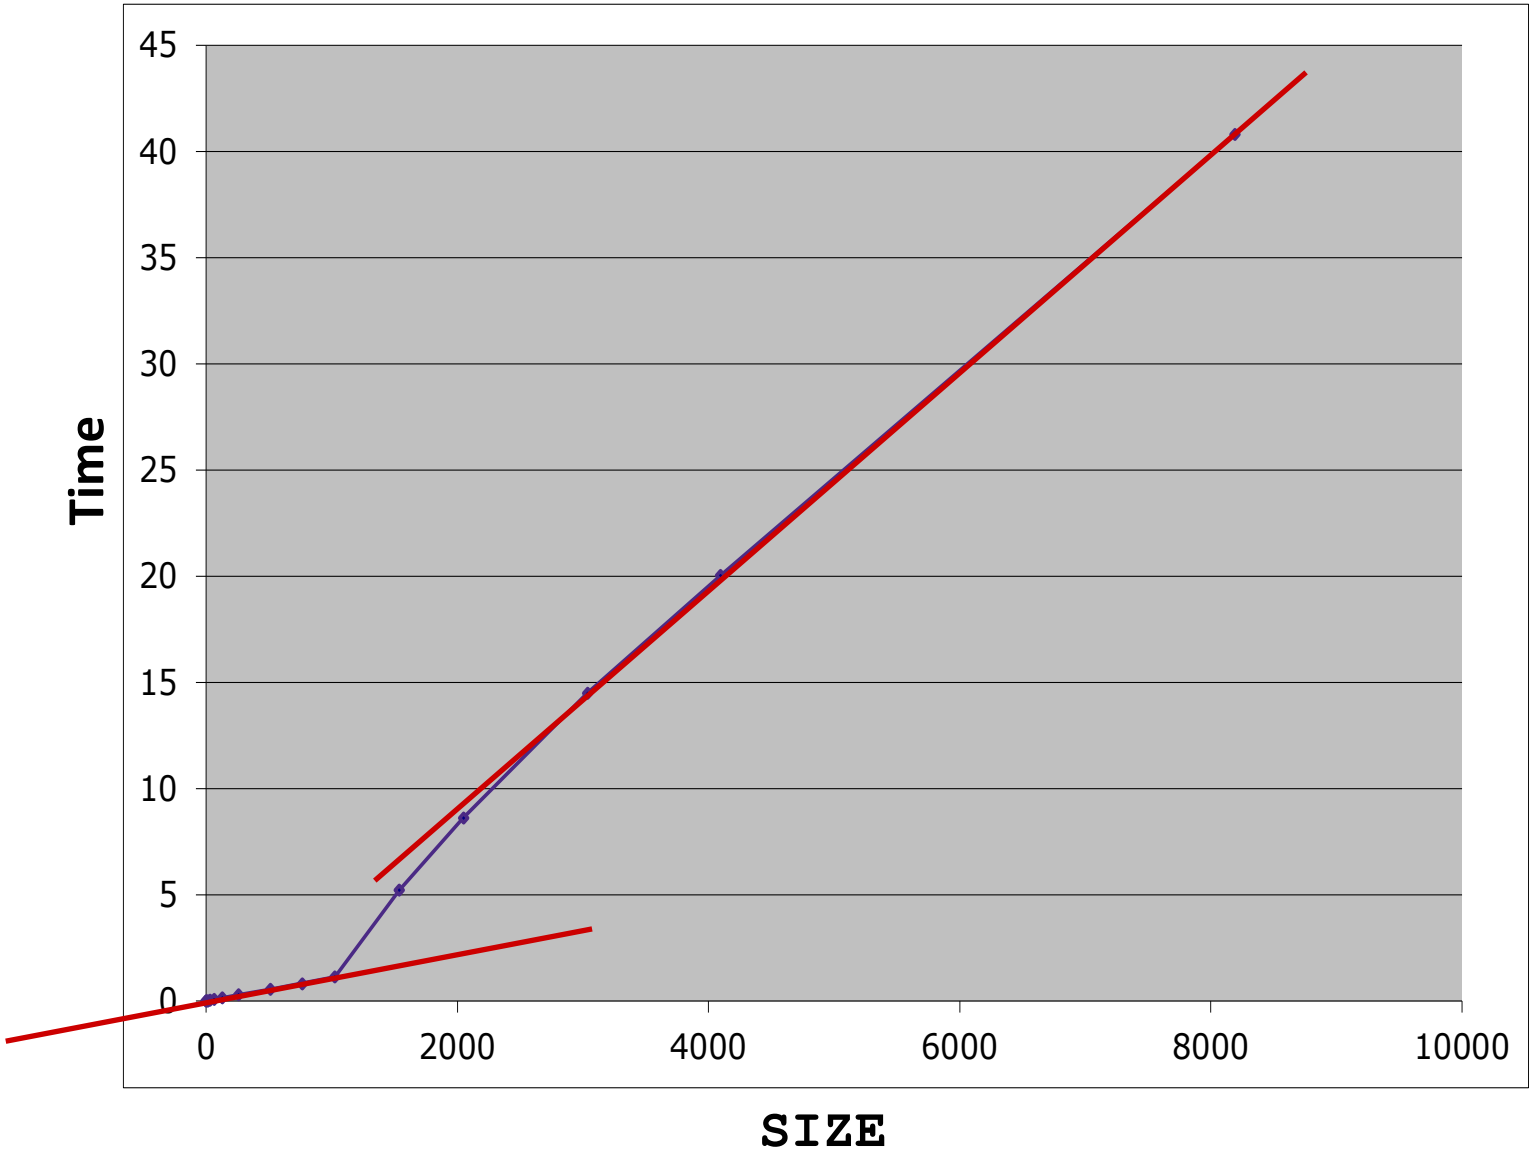
```
int array[SIZE];
int sum = 0;

for (int i = 0; i < 200000; i++) {
  for (int j = 0; j < SIZE; j++) {
    sum += array[j];
  }
}
```

Plot:



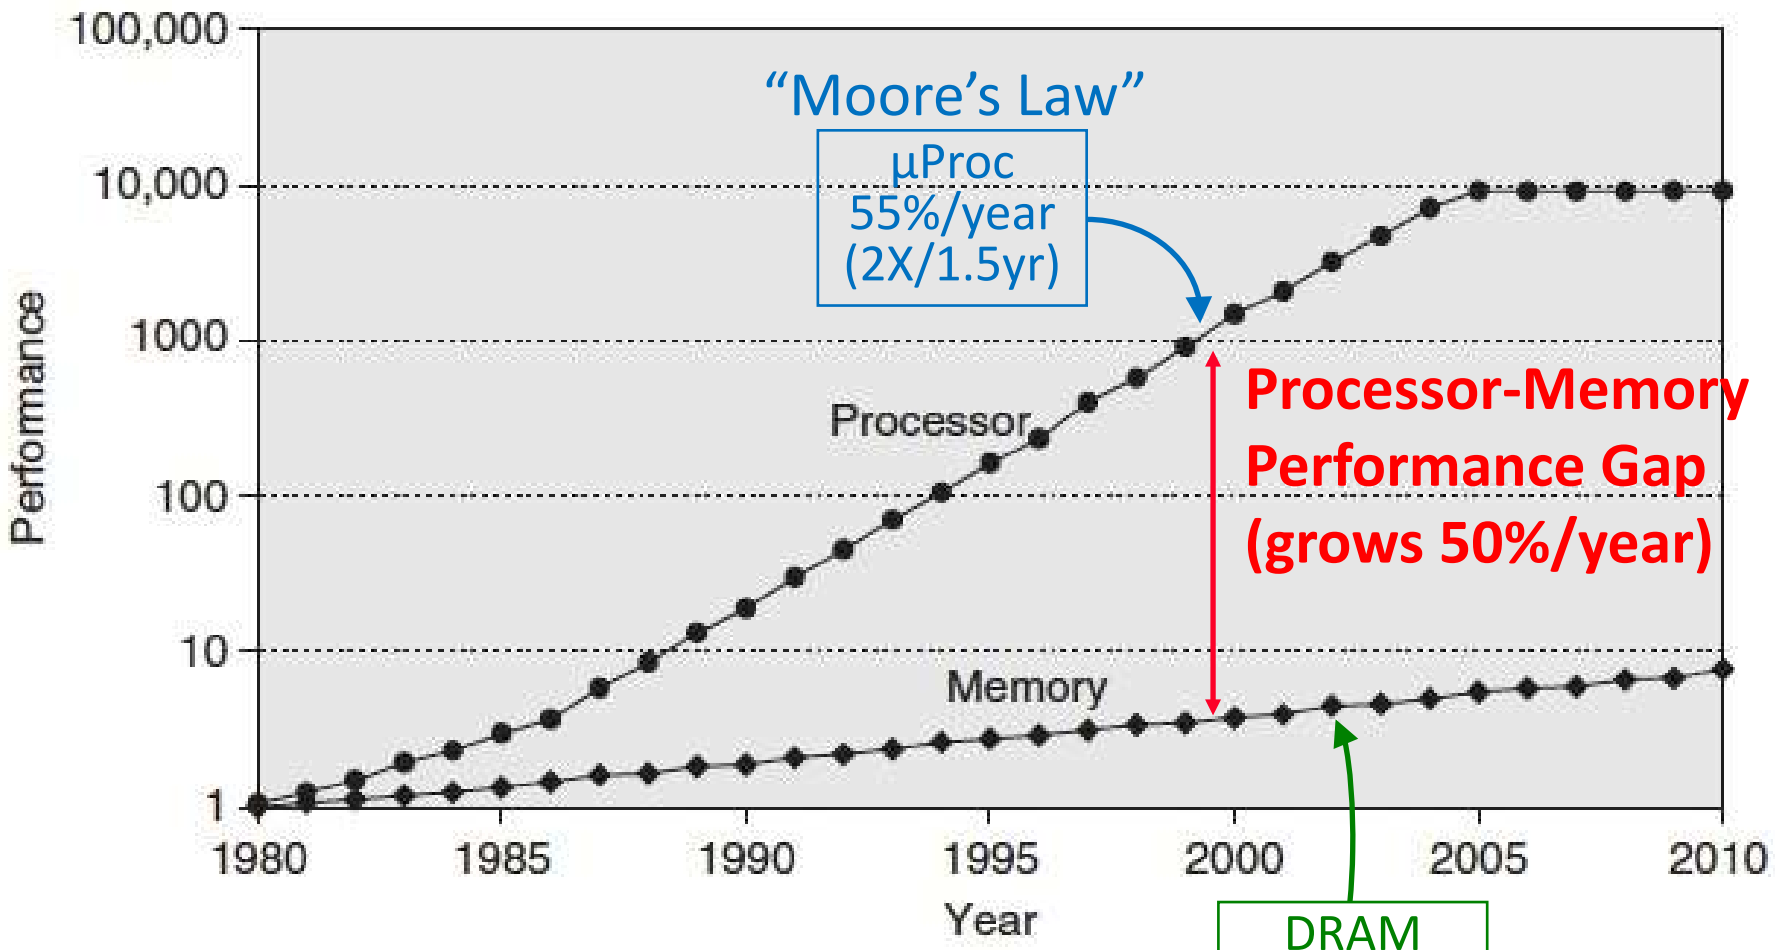
Actual Data



Making memory accesses fast!

- **Cache basics**
- **Principle of locality**
- **Memory hierarchies**
- Cache organization
- Program optimizations that consider caches

Processor-Memory Gap



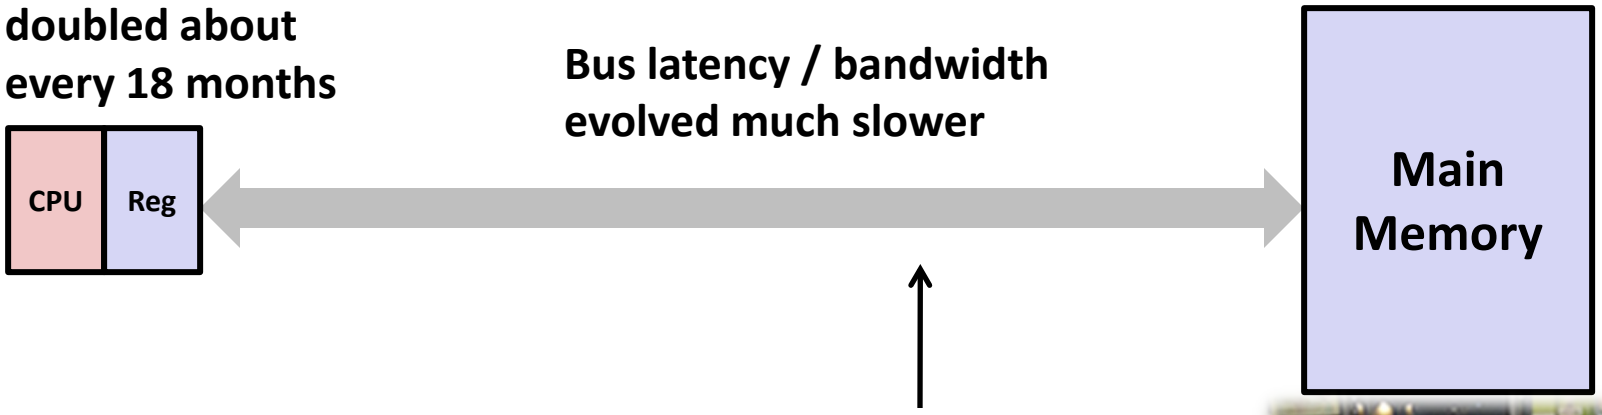
1989 first Intel CPU with cache on chip

1998 Pentium III has two cache levels on chip

Problem: Processor-Memory Bottleneck

Processor performance doubled about every 18 months

Bus latency / bandwidth evolved much slower



Core 2 Duo:
Can process at least
256 Bytes/cycle

Core 2 Duo:
Bandwidth
2 Bytes/cycle
Latency
100-200 cycles (30-60ns)

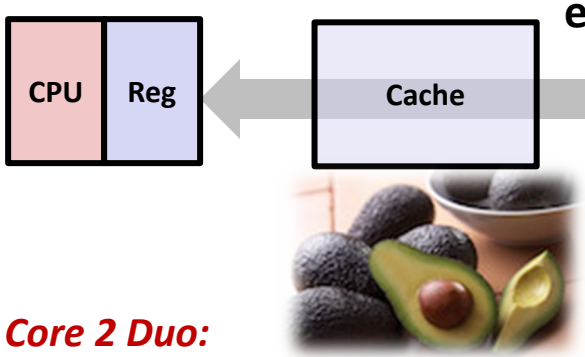
Problem: lots of waiting on memory

***cycle**: single machine step (fixed-time)*

Problem: Processor-Memory Bottleneck

Processor performance doubled about every 18 months

Bus latency / bandwidth evolved much slower



Core 2 Duo:
Can process at least
256 Bytes/cycle

Core 2 Duo:
Bandwidth
2 Bytes/cycle
Latency
100-200 cycles (30-60ns)

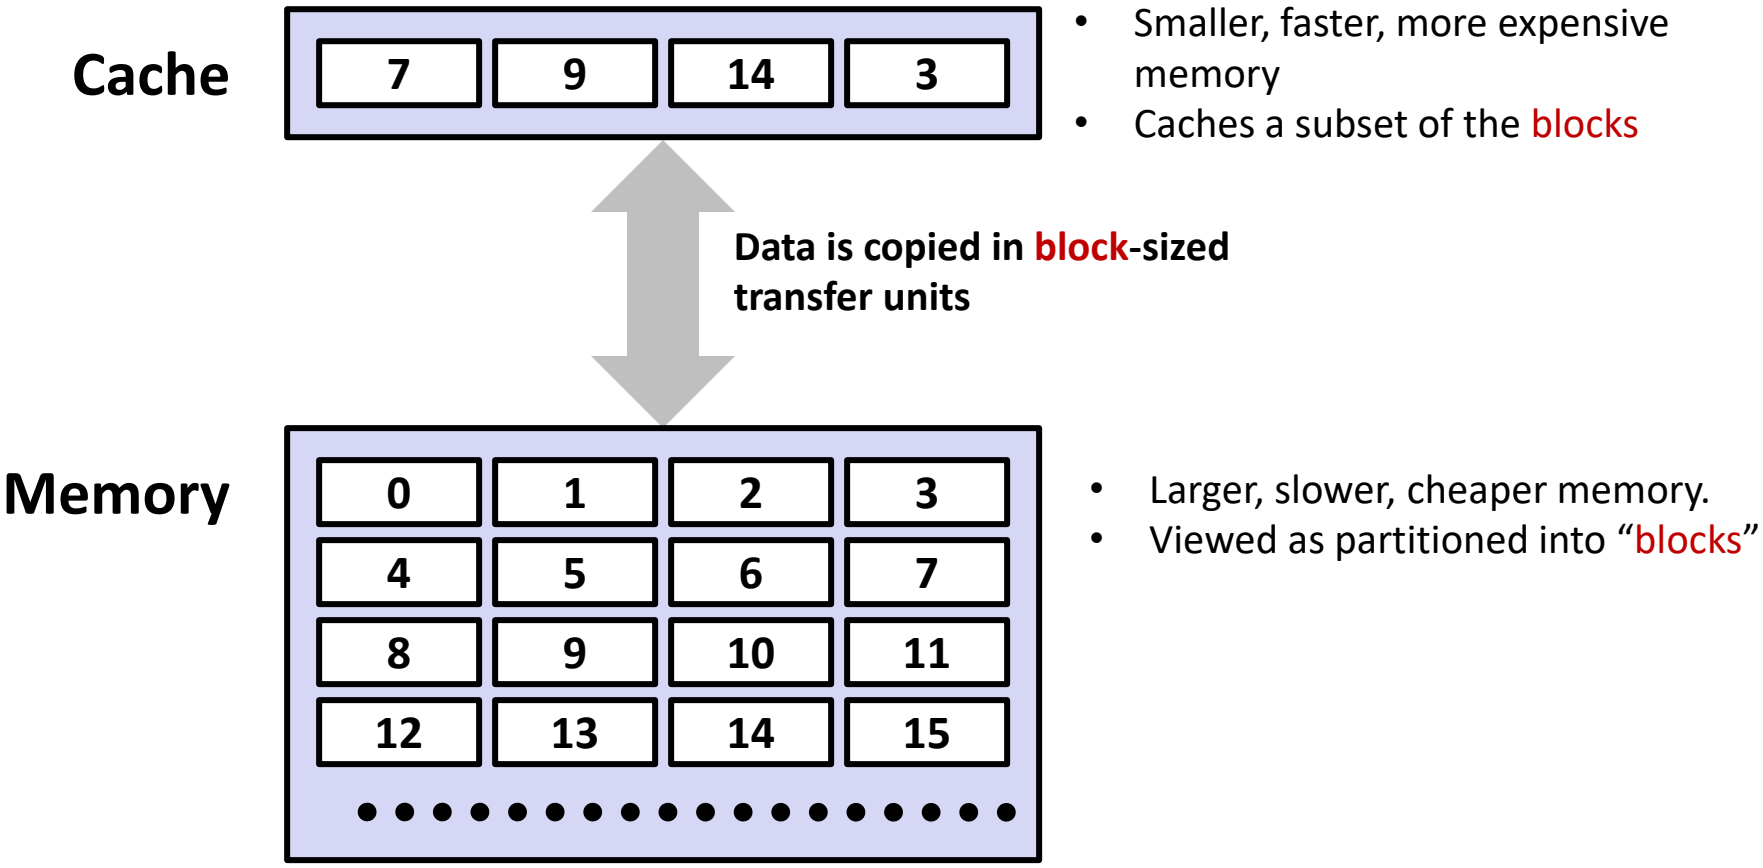
Solution: caches

***cycle**: single machine step (fixed-time)*

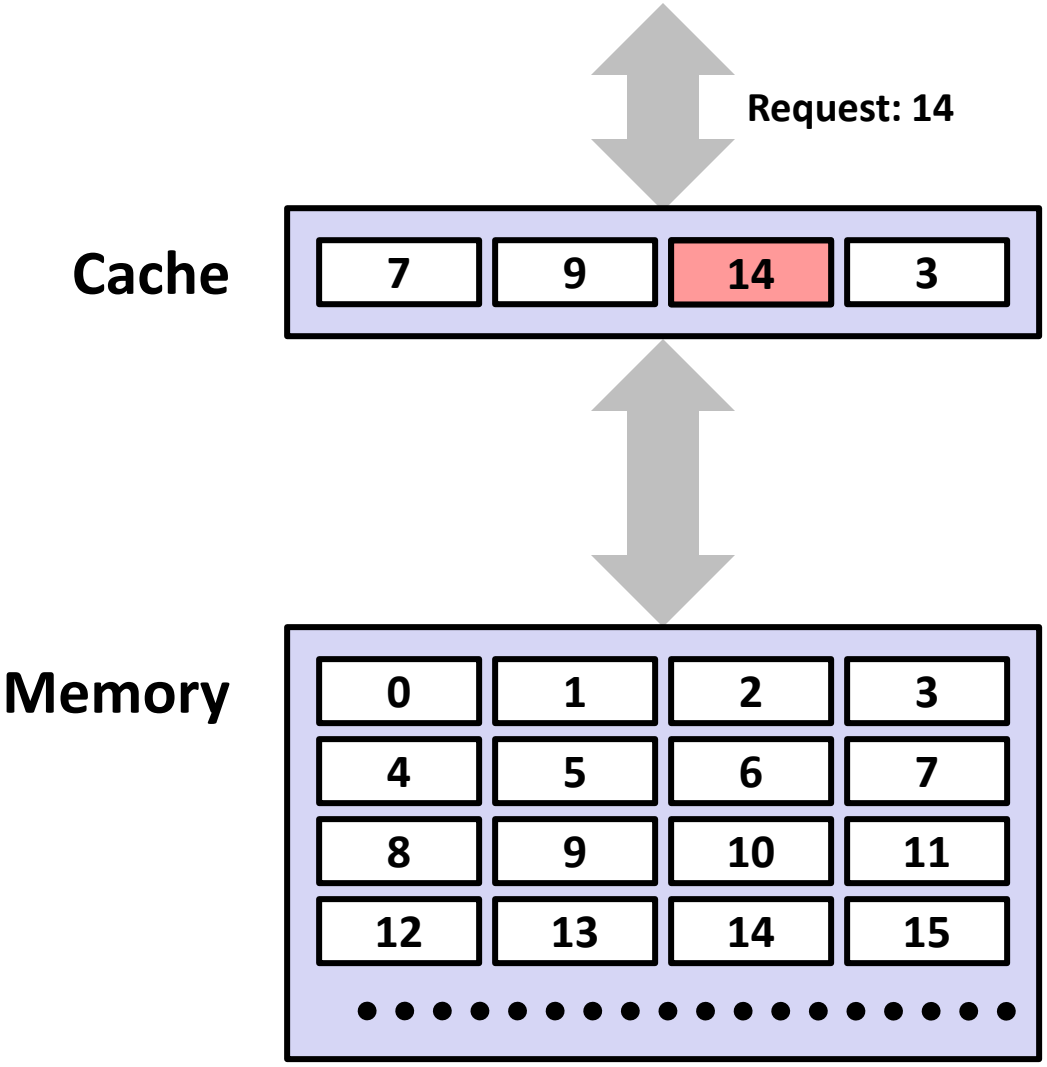
Cache 

- Pronunciation: "cash"
  - We abbreviate this as "$"
- English: A hidden storage space for provisions, weapons, and/or treasures
- Computer: Memory with short access time used for the storage of frequently or recently used instructions (i-cache/I$) or data (d-cache/D$)
  - *More generally:* Used to optimize data transfers between any system elements with different characteristics (network interface cache, I/O cache, etc.)

General Cache Mechanics (Review)



General Cache Concepts: Hit (Review)

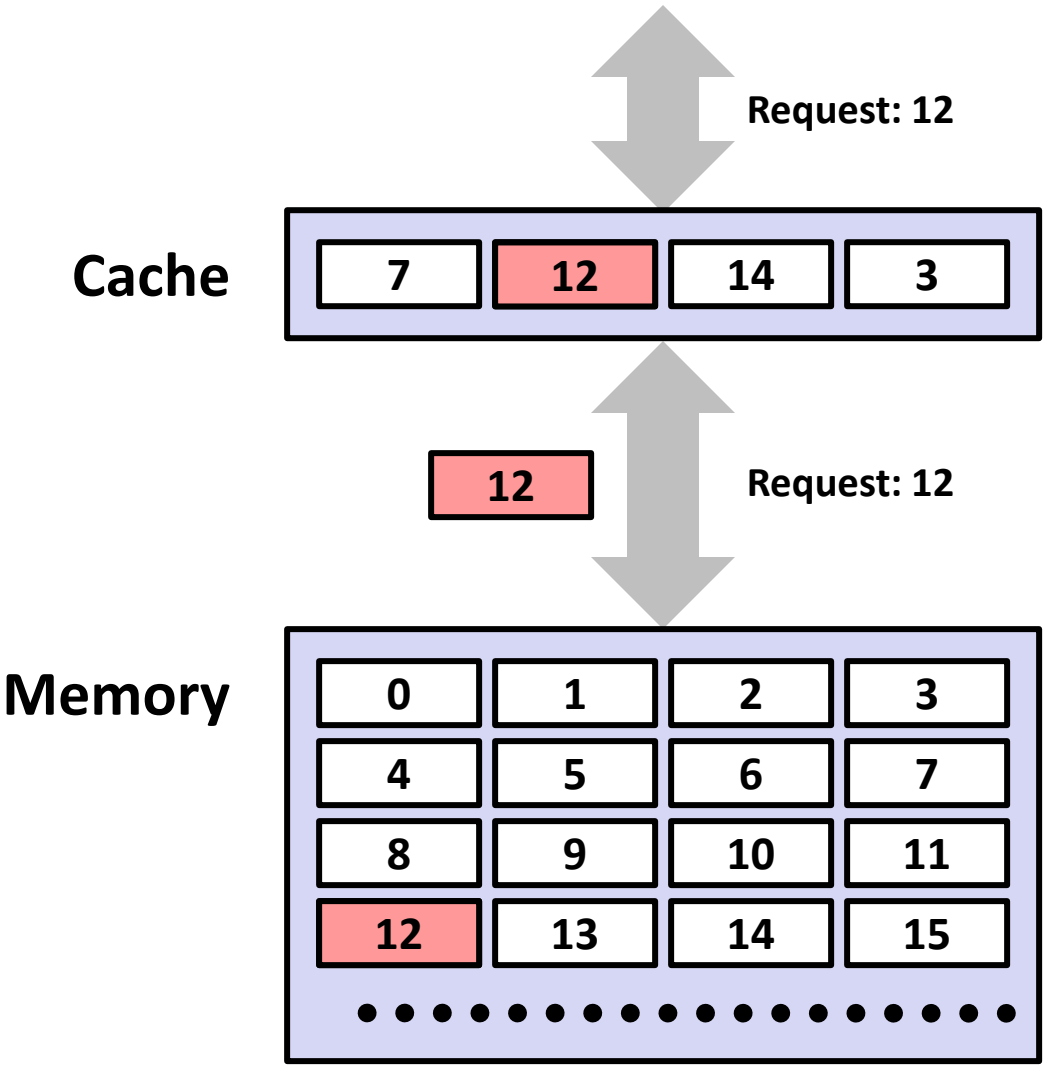


Data in block b is needed

Block b is in cache:
Hit!

Data is returned to CPU

General Cache Concepts: Miss (Review)



Data in block b is needed

Block b is not in cache: Miss!

Block b is fetched from memory

Block b is stored in cache

- Placement policy: determines where b goes
- Replacement policy: determines which block gets evicted (victim)

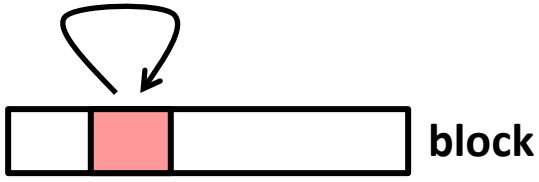
Data is returned to CPU

Why Caches Work (Review)

- Locality: Programs tend to use data and instructions with addresses near or equal to those they have used recently

Why Caches Work (Review)

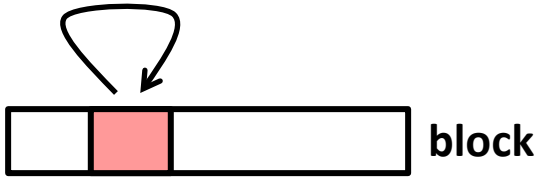
- Locality: Programs tend to use data and instructions with addresses near or equal to those they have used recently



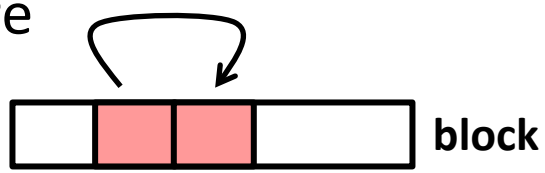
- *Temporal* locality:
  - Recently referenced items are *likely* to be referenced again in the near future

Why Caches Work (Review)

- Locality: Programs tend to use data and instructions with addresses near or equal to those they have used recently



- *Temporal* locality:
  - Recently referenced items are *likely* to be referenced again in the near future



- *Spatial* locality:
  - Items with nearby addresses *tend* to be referenced close together in time

- How do caches take advantage of this?

Example: Any Locality?

```
sum = 0;
for (i = 0; i < n; i++)
{
  sum += a[i];
}
return sum;
```

- **Data:**
  - Temporal: `sum` referenced in each iteration
  - Spatial: consecutive elements of array `a[]` accessed
- **Instructions:**
  - Temporal: cycle through loop repeatedly
  - Spatial: reference instructions in sequence

Locality Example #1 Code

```
int sum_array_rows(int a[M][N])
{
    int i, j, sum = 0;

    for (i = 0; i < M; i++)
        for (j = 0; j < N; j++)
            sum += a[i][j];

    return sum;
}
```

Locality Example #1

```
int sum_array_rows(int a[M][N])
{
    int i, j, sum = 0;

    for (i = 0; i < M; i++)
        for (j = 0; j < N; j++)
            sum += a[i][j];

    return sum;
}
```

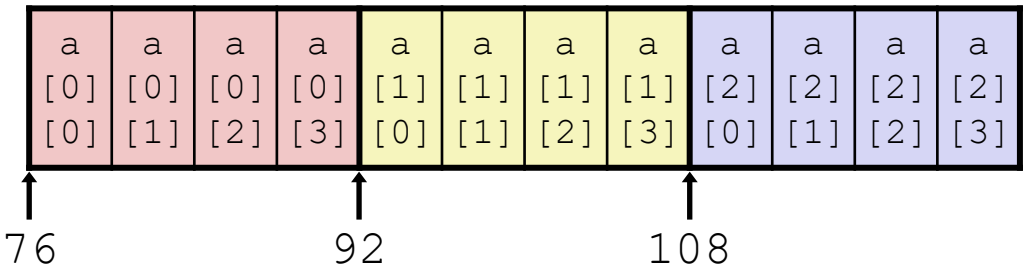
M = 3, N=4

a[0][0]	a[0][1]	a[0][2]	a[0][3]
a[1][0]	a[1][1]	a[1][2]	a[1][3]
a[2][0]	a[2][1]	a[2][2]	a[2][3]

Access Pattern:
stride = ?

1) a[0][0]
2) a[0][1]
3) a[0][2]
4) a[0][3]
5) a[1][0]
6) a[1][1]
7) a[1][2]
8) a[1][3]
9) a[2][0]
10) a[2][1]
11) a[2][2]
12) a[2][3]

Layout in Memory



Note: 76 is just one possible starting address of array a

Locality Example #2 Code

```
int sum_array_cols(int a[M][N])
{
    int i, j, sum = 0;

    for (j = 0; j < N; j++)
        for (i = 0; i < M; i++)
            sum += a[i][j];

    return sum;
}
```

Locality Example #2

```
int sum_array_cols(int a[M][N])
{
    int i, j, sum = 0;

    for (j = 0; j < N; j++)
        for (i = 0; i < M; i++)
            sum += a[i][j];

    return sum;
}
```

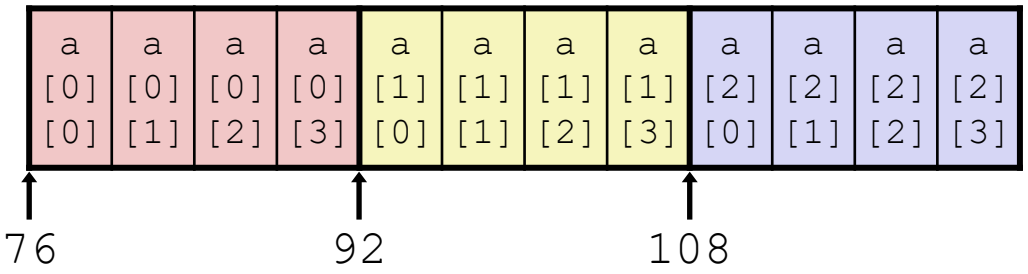
M = 3, N=4

a[0][0]	a[0][1]	a[0][2]	a[0][3]
a[1][0]	a[1][1]	a[1][2]	a[1][3]
a[2][0]	a[2][1]	a[2][2]	a[2][3]

Access Pattern:
stride = ?

1) a[0][0]
2) a[1][0]
3) a[2][0]
4) a[0][1]
5) a[1][1]
6) a[2][1]
7) a[0][2]
8) a[1][2]
9) a[2][2]
10) a[0][3]
11) a[1][3]
12) a[2][3]

Layout in Memory



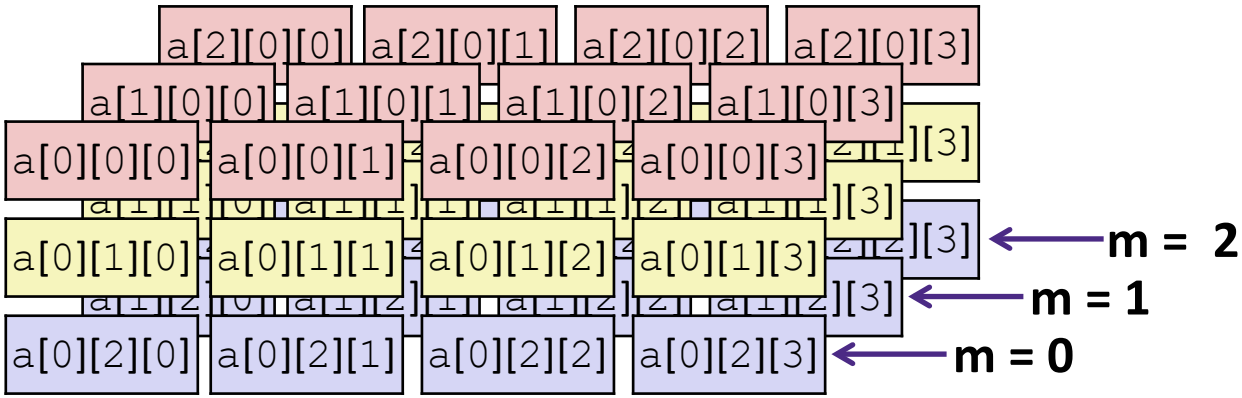
Locality Example #3 Code

```
int sum_array_3D(int a[M][N][L])
{
    int i, j, k, sum = 0;

    for (i = 0; i < N; i++)
        for (j = 0; j < L; j++)
            for (k = 0; k < M; k++)
                sum += a[k][i][j];

    return sum;
}
```

- What is wrong with this code?
- How can it be fixed?



Locality Example #3

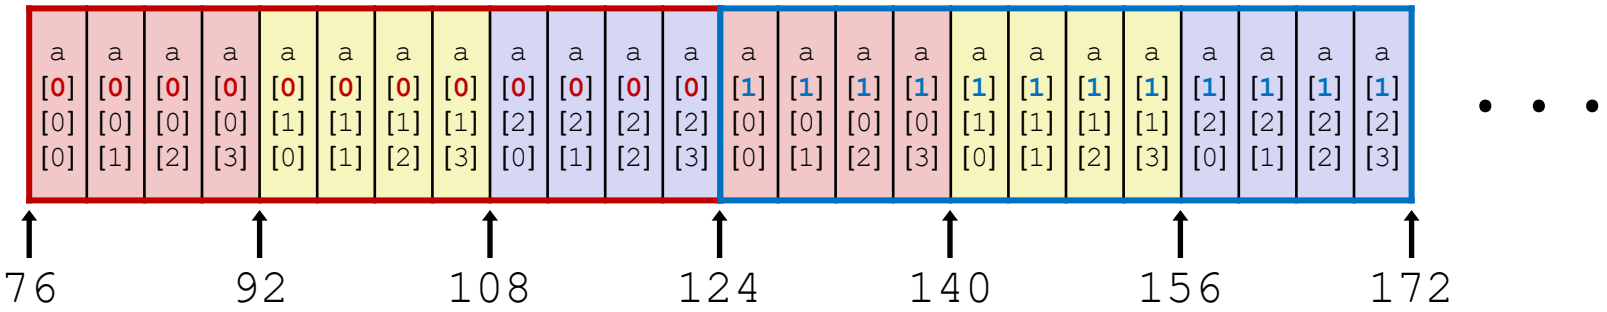
```
int sum_array_3D(int a[M][N][L])
{
    int i, j, k, sum = 0;

    for (i = 0; i < N; i++)
        for (j = 0; j < L; j++)
            for (k = 0; k < M; k++)
                sum += a[k][i][j];

    return sum;
}
```

- What is wrong with this code?
- How can it be fixed?

Layout in Memory (M = ?, N = 3, L = 4)

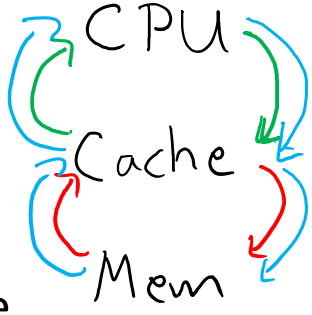


Cache Performance Metrics (Review)

- Huge difference between a cache hit and a cache miss
  - Could be 100x speed difference between accessing cache and main memory (measured in *clock cycles*)
- Miss Rate (MR)
  - Fraction of memory references not found in cache (misses / accesses) = 1 - Hit Rate
- Hit Time (HT)
  - Time to deliver a block in the cache to the processor
    - Includes time to determine whether the block is in the cache
- Miss Penalty (MP)
  - Additional time required because of a miss

Hit takes HT

Miss takes HT + MP



Cache Performance (Review)

- Two things hurt the performance of a cache:
  - Miss rate and miss penalty

- *Average Memory Access Time* (AMAT): average time to access memory considering both hits and misses

  AMAT = Hit time + Miss rate × Miss penalty

  (abbreviated AMAT = HT + MR × MP)

- 99% hit rate twice as good as 97% hit rate!
  - Assume HT of 1 clock cycle and MP of 100 clock cycles
  - 97%: AMAT =
  - 99%: AMAT =

Practice Question

- **Processor specs:** 200 ps clock, MP of 50 clock cycles, MR of 0.02 misses/instruction, and HT of 1 clock cycle

  AMAT =

- Which improvement would be best?

  A. 190 ps clock

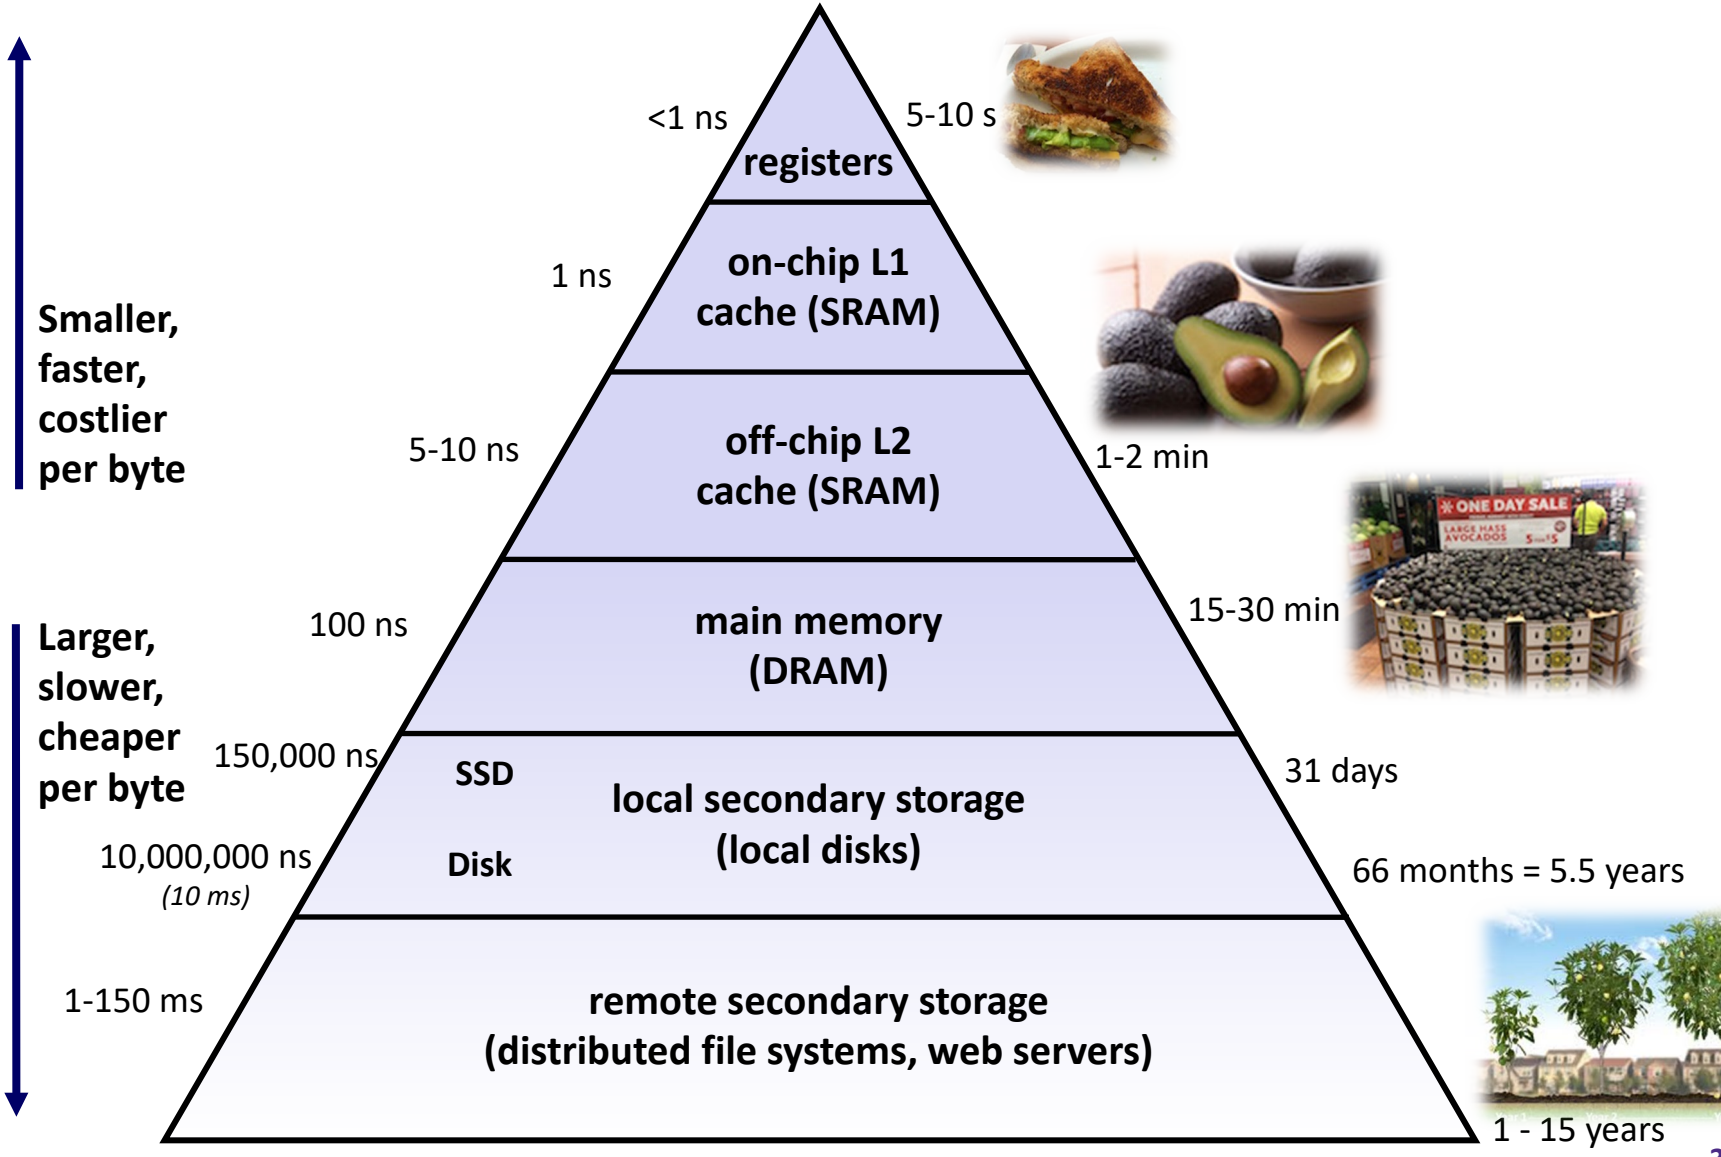
  B. Miss penalty of 40 clock cycles

  C. MR of 0.015 misses/instruction

Can we have more than one cache?

- Why would we want to do that?
  - Avoid going to memory!
- Typical performance numbers:
  - Miss Rate
    - L1 MR = 3-10%
    - L2 MR = Quite small (*e.g.* < 1%), depending on parameters, etc.
  - Hit Time
    - L1 HT = 4 clock cycles
    - L2 HT = 10 clock cycles
  - Miss Penalty
    - P = 50-200 cycles for missing in L2 & going to main memory
    - Trend: increasing!

An Example Memory Hierarchy



Summary

- Memory Hierarchy
  - Successively higher levels contain "most used" data from lower levels
  - Makes use of *temporal and spatial locality*
  - Caches are intermediate storage levels used to optimize data transfers between any system elements with different characteristics
- Cache Performance
  - Ideal case: found in cache (hit)
  - Bad case: not found in cache (miss), search in next level
  - Average Memory Access Time (AMAT) = HT + MR × MP
    - Hurt by Miss Rate and Miss Penalty
