Please read through the entire examination first!

- You have 110 minutes for this exam. Don’t spend too much time on any one problem!
- The last page is a reference sheet. Feel free to detach it from the rest of the exam.
- The exam is CLOSED book and CLOSED notes (no summary sheets, no calculators, no mobile phones).

There are 9 problems for a total of 90 points. The point value of each problem is indicated in the table below. Write your answer neatly in the spaces provided.

Please do not ask or provide anything to anyone else in the class during the exam. Make sure to ask clarification questions early so that both you and the others may benefit as much as possible from the answers.

POINTS WILL BE DEDUCTED if you are writing/erasing after the final bell has rung!

Good Luck!

1. Caches (15 points total)

You are using a byte-addressed machine with 64 KiB of Physical address space. You have a 2-way associative L1 data cache of total size 256 bytes with a cache block size of 16 bytes. It uses LRU replacement and write-allocate and write-back policies.

a) [2 pt] Give the number of bits needed for each of these:

Cache Block Offset: ___________ Cache Tag: ___________

b) [1 pt] How many sets will the cache have? ___________

c) [4 pts] Assume i and j are stored in registers, and that the array x starts at address 0x0. Give the miss rate (as a fraction or a %) for the following two loops, assuming that the cache starts out empty.

```c
#define LEAP 2
#define SIZE 128
int x[SIZE];
... // Assume x has been initialized to contain values.
... // Assume the cache starts empty at this point.
for (int i = 0; i < SIZE; i += LEAP) {
    // Loop 1
    x[i] = x[i] + i * i;
}
for (int j = 1; j < SIZE; j += LEAP) {
    // Loop 2
    x[j] = x[j] + j * 2;
}
```

Miss Rate for Loop 1: ___________ Miss Rate for Loop 2: ___________

d) [8 pts] For each of the changes proposed below, indicate how it would affect the miss rate of each loop above in part c) assuming that all other factors remained the same as they were in the original problem. Circle one of: “increase”, “no change”, or “decrease” for each loop.

<table>
<thead>
<tr>
<th>Change</th>
<th>Loop 1</th>
<th>Loop 2</th>
</tr>
</thead>
<tbody>
<tr>

<td>increase / no change / decrease</td>
<td>increase / no change / decrease</td>
</tr>
<tr>
<td>Cache size from 256 bytes to 512 bytes:</td>
<td>increase / no change / decrease</td>
<td>increase / no change / decrease</td>
</tr>
<tr>
<td>Block size from 16 bytes to 32 bytes:</td>
<td>increase / no change / decrease</td>
<td>increase / no change / decrease</td>
</tr>
</tbody>
</table>
2. Processes (10 points total)
The following function prints out numbers.

```c
void sunny(void) {
    int x = 4;
    if (fork()) {
        x += 6;
    } else {
        x += 1;
    }
    printf("%d ", x);
    if (fork()) {
        x += 1;
    } else {
        x -= 2;
    }
    printf("%d ", x);
    fork();
    exit(0);
}
```

a. [3 pts] List 3 possible outputs of the code above:

(1) __________________________________________
(2) __________________________________________
(3) __________________________________________

b. [2 pts] What is the total number of processes created (including the original process that called `sunny`) by this function? 

________________________

Yes / No

c. [1 pt] Is it possible for the numbers to appear in descending order (highest value to lowest value) in the output?

YES / NO

d. [2 pts] The function call `fork()` returns something. Describe, in general, what `fork()` returns?

e. [2 pts] When context-switching from a process A to a process B, which elements of process B’s state must be restored before process B can begin executing:

- Contents of registers YES / NO
- Contents of L1 cache YES / NO
- Contents of PTBR YES / NO
- Contents of TLB YES / NO
3. Virtual Memory (12 points)

Assume we have a virtual memory detailed as follows:

- 8 KiB Virtual Address Space,
- 2 KiB Physical Address Space,
- a TLB with 16 entries that is 4-way set associative with LRU replacement
- 64 B page size

a) [5 pts] How many bits will be used for:

Page offset? __________

Virtual Page Number (VPN)? _________ Physical Page Number (PPN)? _________

TLB index? _______________ TLB tag? _______________

b) [1 pt] How many TOTAL entries are in this page table?

(It is fine to leave your answer as powers of 2).

_______________
3. (cont.) The current contents of the TLB and (partial) Page Table are shown below:

**TLB**

<table>
<thead>
<tr>

c) [6 pts] Determine the physical address, TLB miss or hit, and whether there is a page fault for the following virtual address accesses (write “Y” or “N” for yes or no, respectively, in the TLB Miss? And Page Fault? columns). If you can’t determine the PPN and/or physical address and/or TLB miss and/or Page Fault, simply write ND (for non-determinable) in the appropriate entry in the table.

<table>
<thead>
<tr>
<th>Virtual Address</th>
<th>VPN (give bits)</th>

</table>
4. Memory Allocation (11 points total)

```c
#include <stdlib.h>
float pi = 3.14;

int main(int argc, char *argv[]) {
    int year = 2019;
    int* happy = malloc(sizeof(int*));
    happy++;
    free(happy);
    return 0;
}
```

a) [3 pts] Consider the C code shown above. Assume that the `malloc` call succeeds and `happy` and `year` are stored in memory (not in a register). Fill in the following blanks with “<” or “>” or “UNKNOWN” to compare the values returned by the following expressions just before `return 0`.

```
&year __________ &main
happy __________ &happy
&pi __________ happy
```

b) [4 pts] The code above has two memory-related errors. Use the line numbers in the code to describe what the errors are and where they occur.

Error #1:

Error #2:

c) [2 pts] (Not related to code at top of page) Give one advantage that next fit placement policy has over a first fit placement policy in an implicit free list implementation.

d) [2 pts] List two reasons why it would be hard to write a garbage collector for the C programming language.

Reason #1:

Reason #2:
5. Java (9 points)

Given our discussion in class, circle whether you would expect the following to be True or False:

i. TRUE / FALSE: An instance of the Car class will be the same size as an instance of the Boat class.

ii. TRUE / FALSE: An instance of the ElectricCar class will be the same size as an instance of the Boat class.

iii. TRUE / FALSE: The vtable for a Car will be the same size as the vtable for a Boat.

iv. TRUE / FALSE: The vtable for a ElectricCar will be the same size as the vtable for a Car.

v. TRUE / FALSE: Each instance of a class will have a separate copy of the vtable for that class.

vi. TRUE / FALSE: Each instance of the ElectricCar class will initially contain the value 0 for rangeInMiles until setRange() is called.

b) More Java....

vii. TRUE / FALSE: The Java Virtual Machine converts Java instructions into bytecodes.

viii. TRUE / FALSE: The Java compiler can always detect if an array reference is out of bounds at compile time.

ix. TRUE / FALSE: The programmer determines if Java objects are allocated on the stack or the heap.
6. Compilation and Structs (8 points)

a) [2 pts] Assume that we compile a C source file into an object file. Which part of the object file keeps track of the symbols and labels needed later by the code in that file?

b) [2 pts] The tool used to combine one or more .o files into an executable is called the: ________ (Hint: the answer is not “gcc”, we want the name of tool that does this particular step.)

c) [4 pts] For this question, assume a 64 bit machine and the following C struct definition.

```c
typedef struct {
    short year;
    char *title;
    char artist[16];
    float rating;
} song;
```

- [1 pt] What does `sizeof(song)` return?________________________________________

- [1 pt] Is there any internal fragmentation? If so, how many bytes and where?

- [1 pt] Is there any external fragmentation? If so, how many bytes and where?

- [1 pt] Is there an ordering of the fields that reduces the amount of fragmentation in the struct? If yes, provide the order. If not, explain why not.
7. Representation (10 points)

a) [4 pts] Consider the signed char \( x = 0b \ 1000 \ 0110 \)

i. What is the value of \( x \)? You may answer as the sum of powers of 2.

ii. Evaluate each of the following expressions:
\[
\begin{align*}
x & \ & (x \gg 4) \\
\sim x \\
x & \ & ^{0xC2}
\end{align*}
\]

0b\underline{____________} 0b\underline{____________} 0b\underline{____________}

b) [3 pts] What 32-bit bit pattern would be used in IEEE 754 floating point to represent the decimal value \(-1\) (e.g. in a C float)?

\[
\begin{array}{c}
S \ (1 \ bit) \\
E \ (8 \ bits) \\
M \ (23 \ bits)
\end{array}
\]

c) [3 pts] On a 64-bit word machine, you are given the following array declaration in C:
\[
\text{double } x[8][2]
\]
If \( x \) starts at address 0, what will the expression \& \((x[2][4])\) evaluate to? If “unknown” or “cannot be guaranteed”, state that. Otherwise give your answer as a single number in \textit{decimal}. 

8. Pointers & Memory (9 points)
We are using a 64-bit x86-64 machine (little endian). Below is the husky function disassembly, showing where the code is stored in memory. Hint: read the questions before reading the assembly!

```
00000000000400507 <husky>:
  400507:       48 83 fe 02             cmp    $0x2,%rsi
  40050b:       7f 05                   jg     400512 <husky+0xb>
  40050d:       48 8d 04 7f             lea    (%rdi,%rdi,2),%rax
  400511:       c3                      retq
  400512:       48 83 ec 08             sub    $0x8,%rsp
  400516:       48 83 ee 01             sub    $0x1,%rsi
  40051a:       e8 e8 ff ff ff          callq  400507 <husky>
  40051f:       48 83 c4 08             add    $0x8,%rsp
  400523:       c3                      retq
```

a) [4 pts] What are the values (in hex) stored in each register shown after the following x86 instructions are executed? Remember to use the appropriate bit widths.

<table>
<thead>
<tr>
<th>Register</th>
<th>Value (in hex)</th>
</tr>
</thead>
<tbody>
<tr>
<td>%rax</td>
<td>0x0000 0000 0040 050d</td>
</tr>
<tr>
<td>%rsi</td>
<td>0x0000 0000 0000 0010</td>
</tr>
</tbody>
</table>

```
movswl 4(%rsi,%rax), %ecx
leaw (%rsi,%rsi,2), %di
```

b) [4 pts] Complete the C code below to fulfill the behaviors described in the inline comments using pointer arithmetic. Let `short* shortP = 0x400514`

```
short v1 = shortP[_________];             // set v1 = 0x048d
long* v2 = (long*) ((__________*)shortP + 3); // set v2 = 0x400520
```

(c) [1 pt] `husky` is a recursive function. What address is put on the stack when `husky` calls itself. Give the exact address:
9. Buffer Overflow (6 points)
The following piece of C code is vulnerable to buffer overflow:

```c
void foo() {
    char buf[8];
    gets(buf);
    printf("You typed %s!\n", buf);
}

int main() {
    foo();
    return 0;
}
```

a) [2 pts] What line of this C code is vulnerable, and why?

The x86-64 assembly below corresponds to the C code above:

```
.LC0:
    .string "You typed %s!\n"

foo:
    subq  $24, %rsp
    movq  %rsp, %rdi
    call  gets
    movq  %rsp, %rsi
    movl  $.LC0, %edi
    movl  $0, %eax
    call  printf
    addq  $24, %rsp
    ret

main:
    subq  $8, %rsp
    call  foo()
    movl  $0, %eax
    addq  $8, %rsp
    ret
```

b) [2 pts] How many bytes do you need to enter to overwrite the return address to `main` with a stack address?

c) [2 pts] Suppose you know that there is a function at memory address 0x40806c that you want to execute. What bytes can you give as input such that the vulnerable program will call your function? (Note: we are looking for bytes, not ASCII characters). If you need to enter the same byte multiple times, you may write “<byte> * <number of times>”
