# CSE 351 Summer 2025, Final Exam August 22, 2025

Full Name:	
UW NetID:	@uw.edu
Seat Number:	
I certify that all work is my own. I had no prior knowledge of exam contents nor will I share the contents with any student in CSE 351 who has not yet taken the exam. Violation of these terms may result in a failing grade.  Signature:	

### **Instructions:**

- Do not turn the page until you are instructed to begin.
- This exam is closed book (no smartphones, calculators, or other electronic devices). Turn off any mobile devices, remove hats, headphones, and smartwatches, and put them away.
- You are allowed one page (U.S. letter, double-sided) of *handwritten* notes. Write your name and NetID on your notes page and turn it in with your exam.
- This exam contains 5 problems and 1 bonus question spread across 7 pages. The last page is a reference sheet. You may detach it from the rest of the exam.
- When a box or line is provided, please write your answer in the box or on the line.
- If a question involves bubbling in a \( \), please fill the shape in completely.
- You have 60 minutes to complete this exam. Please stop writing when the clock stops.

### **Advice:**

- Read the questions carefully before starting. Make sure you understand what they're asking before you start working on them!
- This is a long exam! There are plenty of opportunities to show what you've learned. Don't spend too much time on any one problem, skip around, and make sure you have the chance to attempt all the questions.
- Relax! You are here to learn:)

Question	1	2	3	4	5	6	Total
Points	6	11	10	13	10	1	51
Page	2	3	4	5	6	7	

1. (	(6	nainte)	<b>Processes</b>
1. (	O	DOMES	Processes

Consider the C function foo():

```
void foo() {
  int x = 2;
  int y = 0;
  int* p = malloc(sizeof(int));
  *p = 0;

while (y < x) {
   if (fork()) {
     y = 100;
   }
  printf("x%d ", x);
   *p += x;
  x--;
}

printf("p%d ", *p);
free(p);
}</pre>
```

- (a) (2 points) How many processes are created when we run foo(), including the original (parent) process?
- (b) (4 points) Is it possible for foo () to produce the output "x2 x2 p2 p3 x1 p3 x1"? Explain why or why not in 1-2 sentences.

Yes (Possible)	O No (Impossible)
----------------	-------------------

Explain:

Name:	UW NetID:

2. (11 points) Cachin	ning
-----------------------	------

We run the C code below on a system with the following parameters:

- 8 KiB physical address space
- 512 B cache size
- 2-way set associativity
- 16 B cache blocks
- Write-back, write-allocate

```
struct AB {
   long a;
   char b;
};

struct AB X[16]; // X starts at address 0x0800

// ...initialize X...

for (int i = 0; i < 16; i += 2) {
   X[i].a = X[i].a + X[i].b;
   X[i].b = X[i+1].b + 1;
}</pre>
```

(a) (4 points) Give the address size and TIO breakdown for this system:

Address bits:	Tag bits:			
Index bits:	Offset bits:			

(b) (4 points) What is the <u>miss rate</u> of the code above? Ignore any code not shown. Assume that the cache starts cold (empty) and <u>i</u> and <u>j</u> are stored in registers. For partial credit, you may *optionally* provide the access pattern of this code.

Miss	rate:	
------	-------	--

*Optional* access pattern for partial credit (you may not need all boxes):

Address:			
Hit/Miss:			
Address:			
Hit/Miss:			

(Question continues on next page.)

Name:	UW NetID:	
	 	_

## 4. (13 points) Virtual Memory & the Memory Hierarchy

Consider a system with the following parameters:

- 64 KiB virtual address space
- 11-bit physical addresses
- 256 B pages
- A 4-entry direct-mapped TLB with LRU replacement
- (a) (4 points) Fill in the following values:

Page offset bits:	<b>VPN</b> bits:			
TLB index bits:	TLB tag bits:			

(b) (9 points) Assume that the TLB and page table begin in the state shown below:

Set	TLBT	Valid	PPN	Set	TLBT	Valid	PPN
0	0b10 1010	0	0x4000	2	0b11 1111	1	0x10AA
1	0b00 1000	1	0x5008	3	0b00 0110	0	0x3801

## Partial page table:

VPN	PPN	Valid	VPN	PPN	Valid
0x21	0x5008	1	0xA8	0x4000	0
0x50	0x12CC	1	0xC1	0x3FF0	1

Fill in the table below with the results of each virtual memory access in the sequence. <u>Each access occurs after the access(es) before it.</u> If a given box cannot be determined, write "ND".

Access	TLB hit? (Hit/Miss)	Page Fault? (Y/N)	PPN (in hex)
Read 0xA800			
Read 0xC140			
Read 0x21BB			

## 5. (10 points) Dynamic Memory Allocation & Memory Bugs

Consider the following C code:

```
1
     long* ptrs[6];
2
     for (int i = 0; i < 6; i++) {</pre>
3
       if (i%2 != 0) { // i is odd
4
         ptrs[i] = malloc(sizeof(long)*i);
5
       } else {
6
         ptrs[i] = ptrs[i - 1];
7
         *(ptrs[i]) = i;
8
       }
9
10
      for (int j = 0; j < 6; j++) {
11
        free(ptrs[j]);
12
      }
```

(a) (4 points) The code above contains <u>at least two</u> memory-related bugs! Identify <u>two</u> of these bugs, making sure to reference the <u>line(s)</u> of code where they occur.

You do not need to use the exact wording from lecture for each type of bug, but it should be clear what problem you're describing. The order in which you give the bugs does not matter. You also do <u>not</u> need to say how to fix each bug.

First bug:			
Second bug:			

(Question continues on next page.)

		UW NetID:
