Intro to Digital Design
Computer Components, FPGAs

Instructor: Justin Hsia

Teaching Assistants:

Emilio Alcantara
Eujean Lee
Naoto Uemura
Pedro Amarante
Wen Li

Relevant Course Information

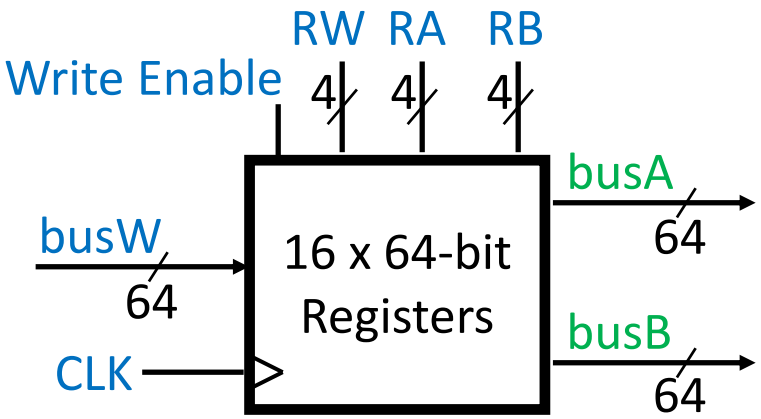
- Lab 8 – Project
  - Reports due Friday, May 31 @ 11:59 pm
  - Project check-ins this week during demos
  - Demos can be scheduled outside of the lab hours by making a private Ed Discussion post
- Lab kit (+ Okiocam) return when you are done
- **Quiz 3** is next week: Tuesday, May 28 @ 1:40 pm
  - 60 (+10) minutes, worth 14% of your course grade
  - Topics: Timing, Routing Elements, Computational Building Blocks, Verilog
  - Past Quiz 3 (+ solutions) on website: Course Info → Quizzes
    - **Note:** Your Quiz 3 will be a little different – focus on problem solving

Outline

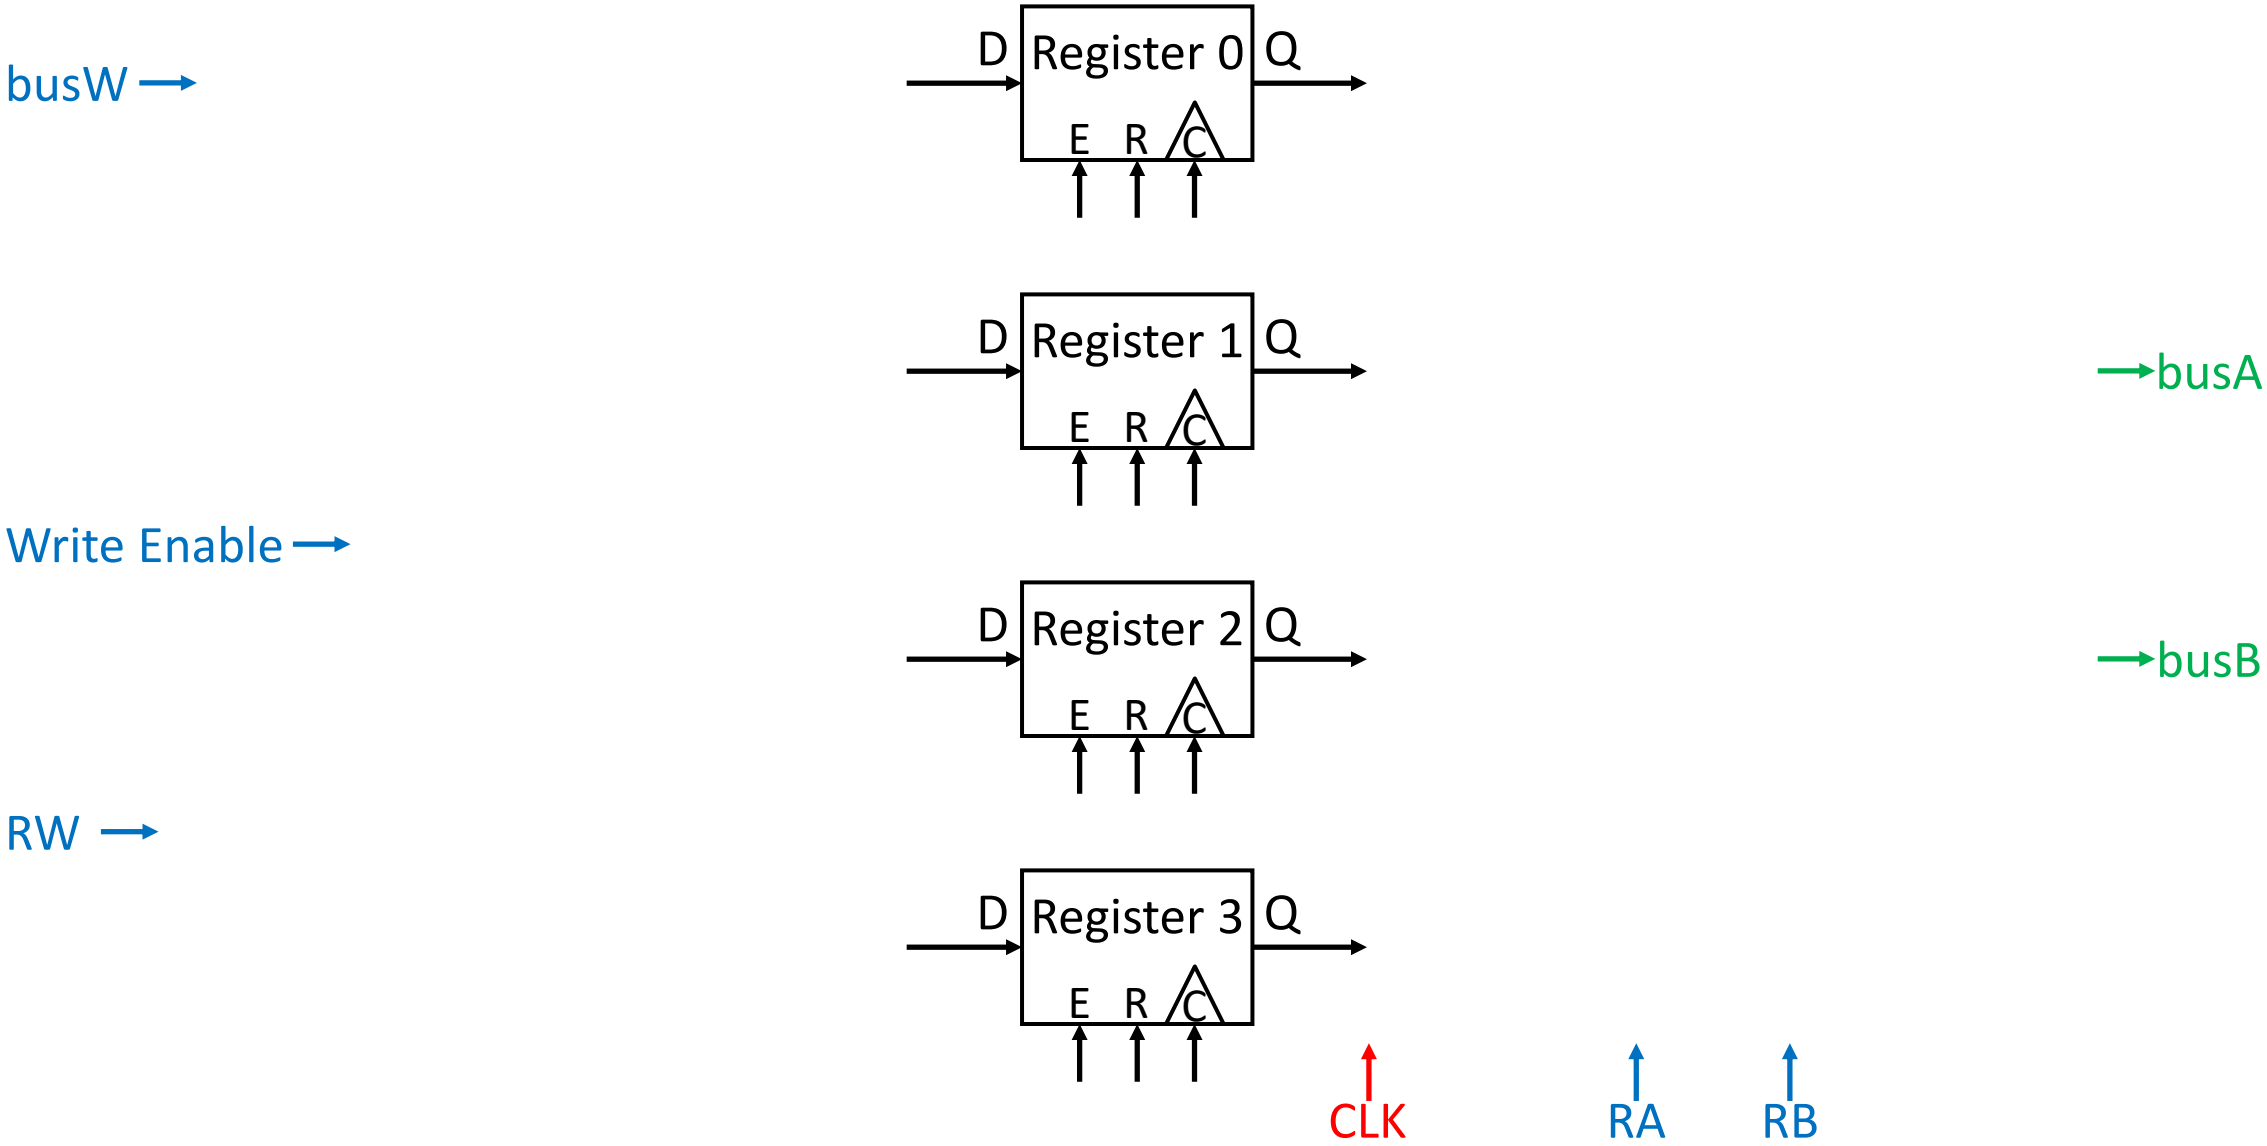
- **Computer Components (Cont.)**
  - **Register File**
  - **Datapath teaser**
  - **Serial Communication**
- FPGAs
- Course Wrap-up

Storage Element: Register File

- Contains all programmer-accessible registers
  - Output buses busA and busB
  - Input bus busW
- Register selection
  - Place data of registers RA/RB (numbers) onto busA/busB
  - Store data on busW into register RW (number) when Write Enable is 1

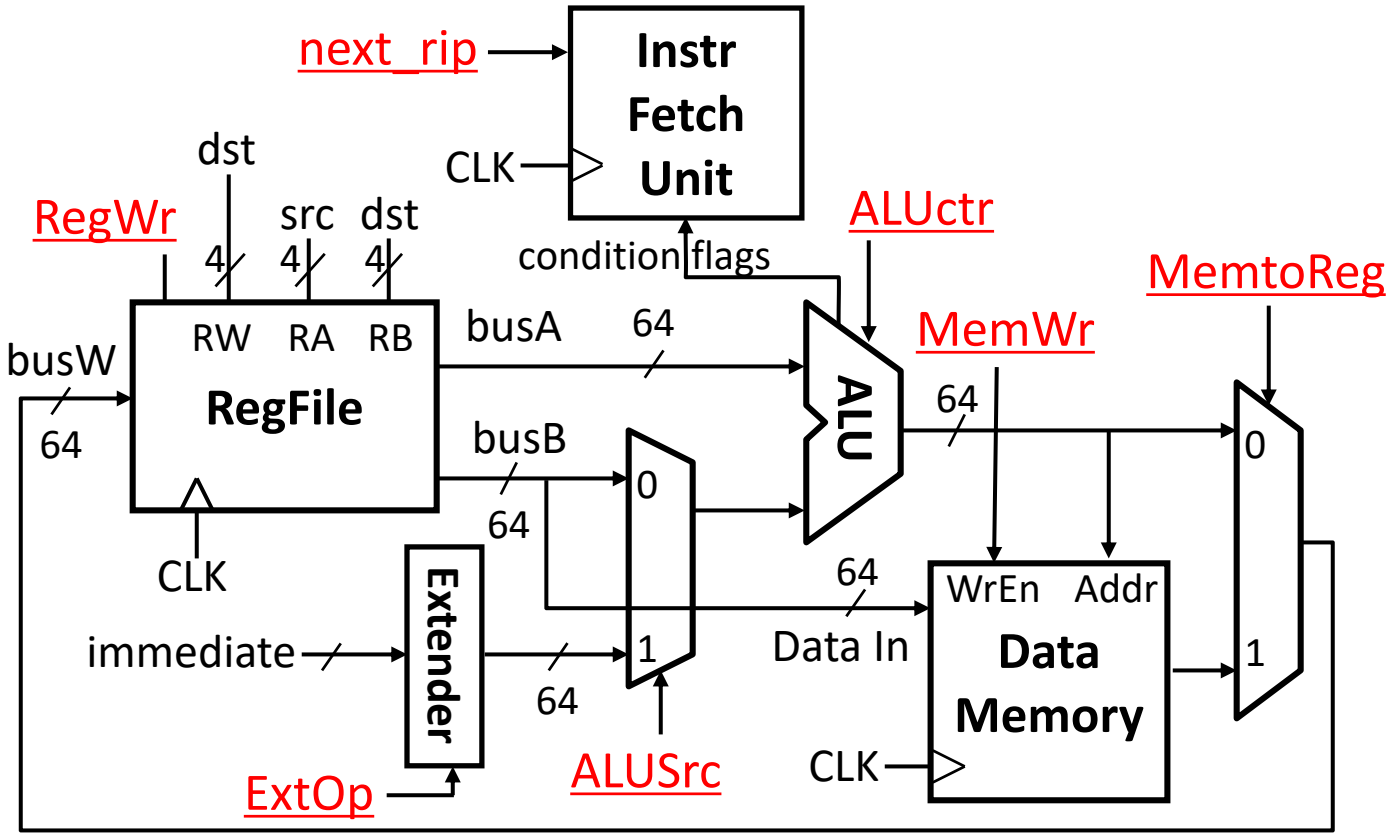


Simple Register File (4 Registers)



Datapath Teaser

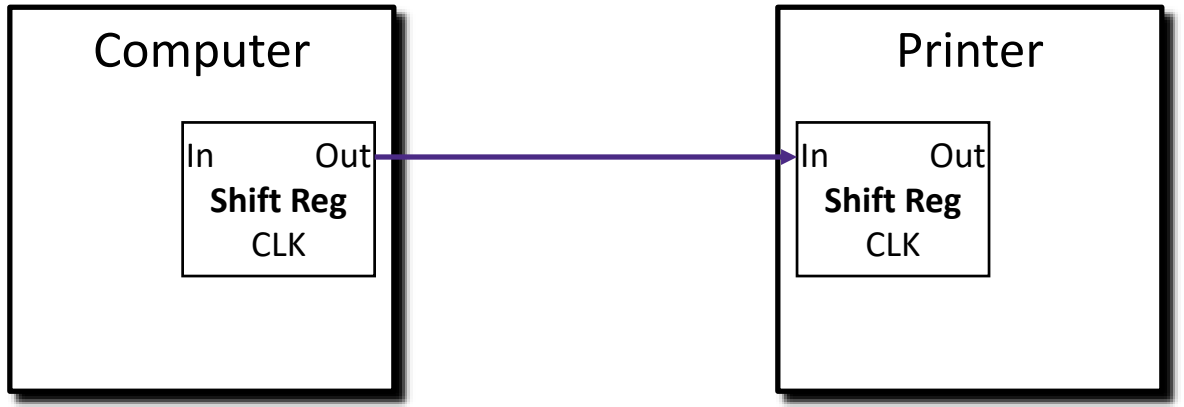
- Instructions of the form: `operation src, dst`
  - Signals in **red** are set by Control based on `operation`
  - This is inaccurate/incomplete but gives you a vague idea of connecting parts



Transfer of Data

- Two modes of communication
  - **Parallel:** all bits transferred at the same time
  - **Serial:** one bit transferred at a time

- Shift registers can be used for serial transfer:

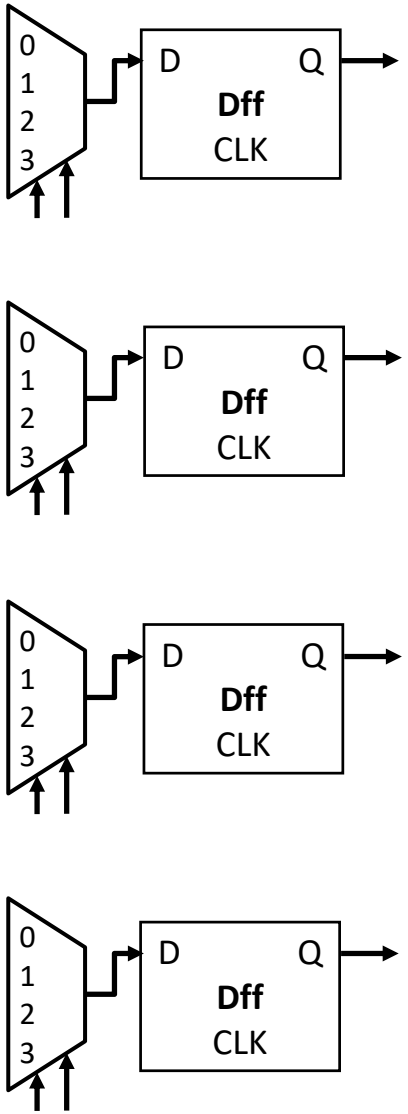


- In general, shift registers can allow for either or both modes (S for serial, P for parallel) at input and output
  - Examples: SISO, SIPO, PISO

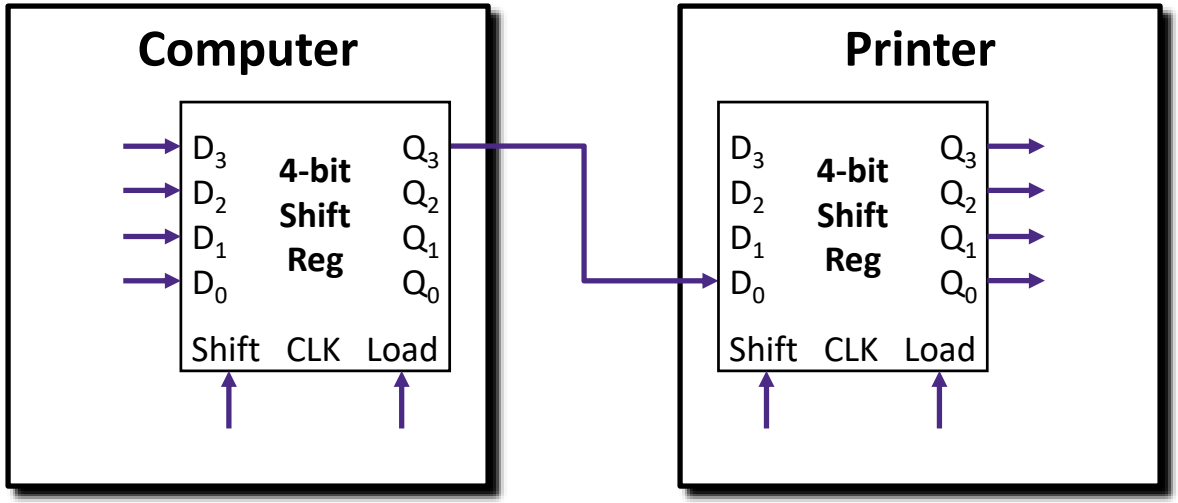
Shift Register w/Parallel Load

- **Note:** To avoid extra input, use D_0 input as "shift in"

Load	Shift	Action
0	0	Q = old Q
0	1	Shift (left)
1	X	Parallel load



Conversion between Parallel & Serial



Cycle

6

Shift	Load	Q0	Q1	Q2	Q3
		X	X	X	X

Shift	Load	Q0	Q1	Q2	Q3
		X	X	X	X

Shifter in Verilog

```
module leftshifter #(parameter WIDTH=8)
  (s_out, p_out, shift, load, d_in, clk);

  output logic s_out;              // serial out
  output logic [WIDTH-1:0] p_out; // parallel out
  input  logic [WIDTH-1:0] d_in;  // data in (shift in d0)
  input  logic shift, load, clk;

  always_ff @(posedge clk) begin
    if (load)
      p_out <= d_in;
    else if (shift)
      p_out <= {p_out[WIDTH-2:0], d_in[0]};
  end

  assign s_out = p_out[WIDTH-1];

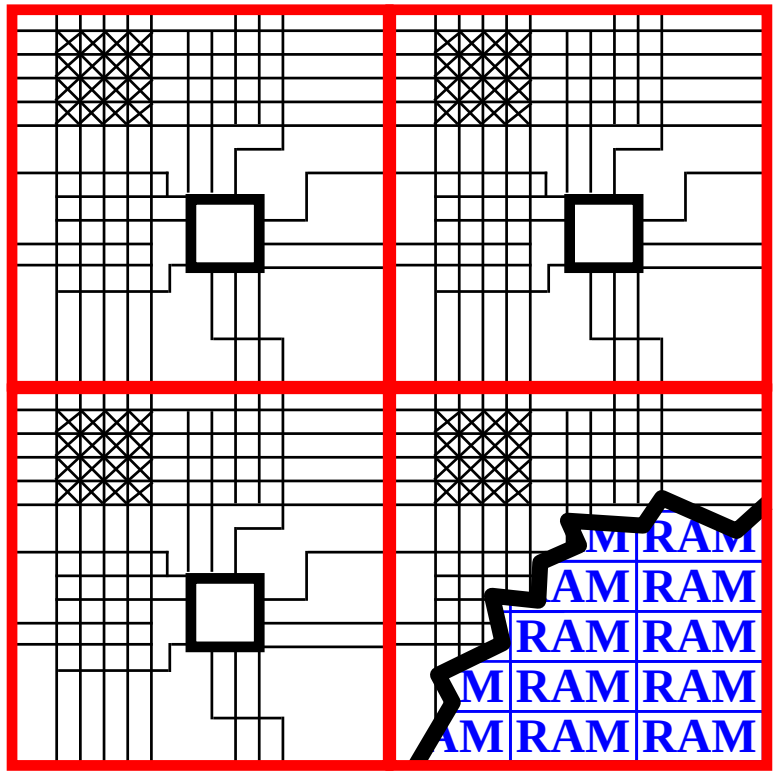
endmodule  // leftshifter
```

Technology Break

Outline

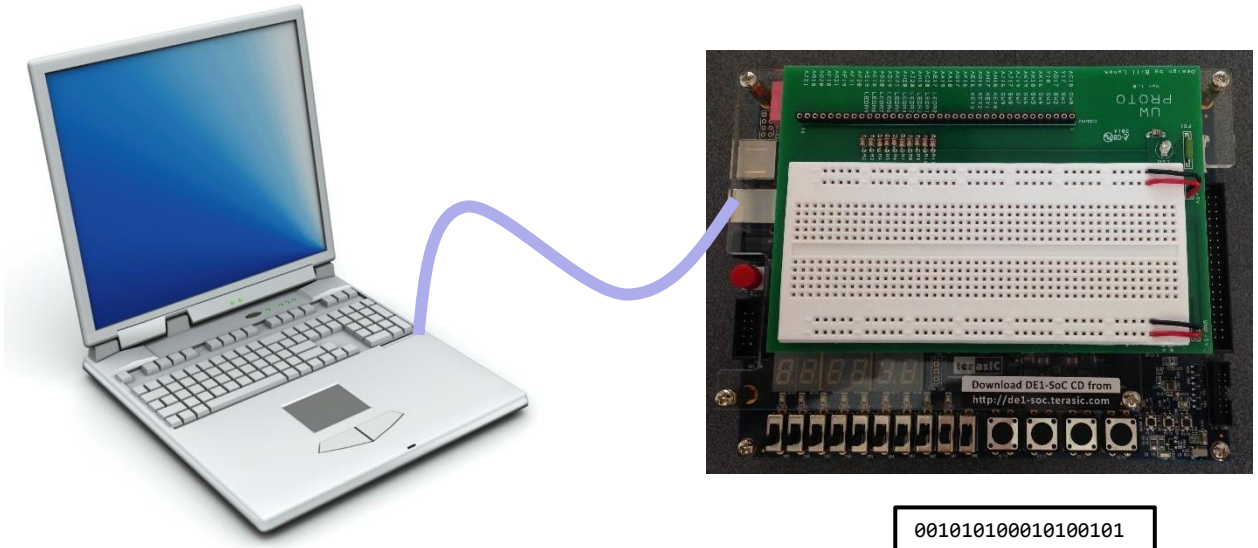
- Computer Components (Cont.)
  - Register File
  - Datapath teaser
  - Serial Communication
- **FPGAs**
- Course Wrap-up

Field Programmable Gate Arrays (FPGAs)



- Logic cells (□) embedded in a general routing structure
- Logic cells usually contain:
  - 6-input Boolean function calculator
  - Flip-flop (1-bit memory)
- All features are electronically (re)programmable

Using an FPGA



```
//   Verilog   code   for   2-input
multiplexer

module AOI (F, A, B, C, D);
  output F;
  input A, B, C, D;

  assign F = ~((A & B) | (C & D));
endmodule

module MUX2 (V, SEL, I, J);   // 2:1
multiplexer
  output V;
  input SEL, I, J;
  wire SELB, VB;

  not G1 (SELB, SEL);
  AOI G2 (VB, I, SEL, SELB, J);
  not G3 (V, VB);
endmodule
```

Verilog

FPGA CAD Tools

```
0010101000101001 01
0010100100110001 0

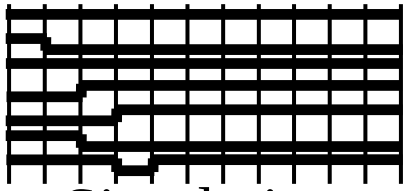
```

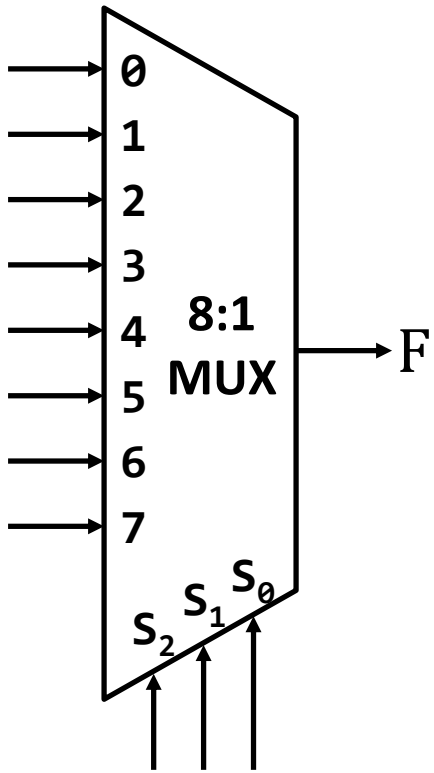
Bitstream



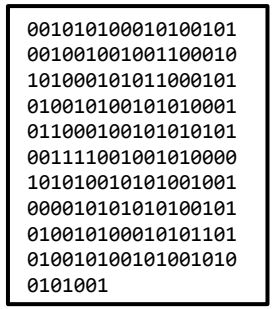
Simulation

FPGA Combinational Logic

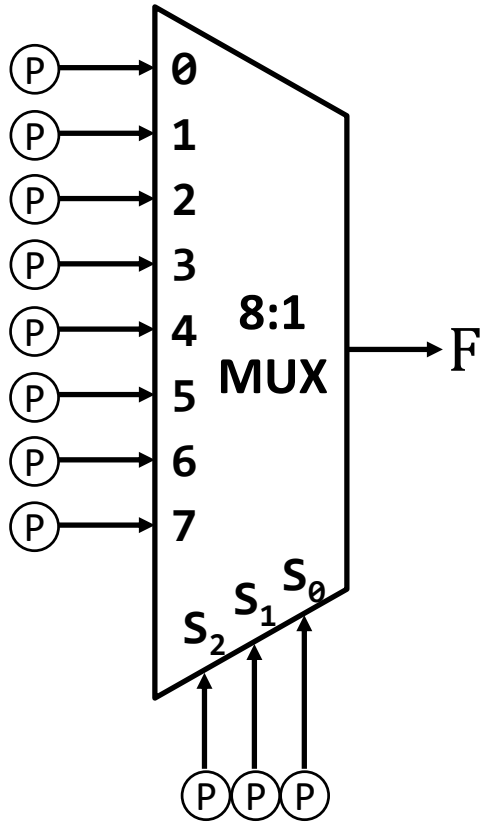
- Create arbitrary combinational binary function $F(A,B,C)$ using MUXes
  - Creates a **Lookup Table (LUT)**



FPGA Programming



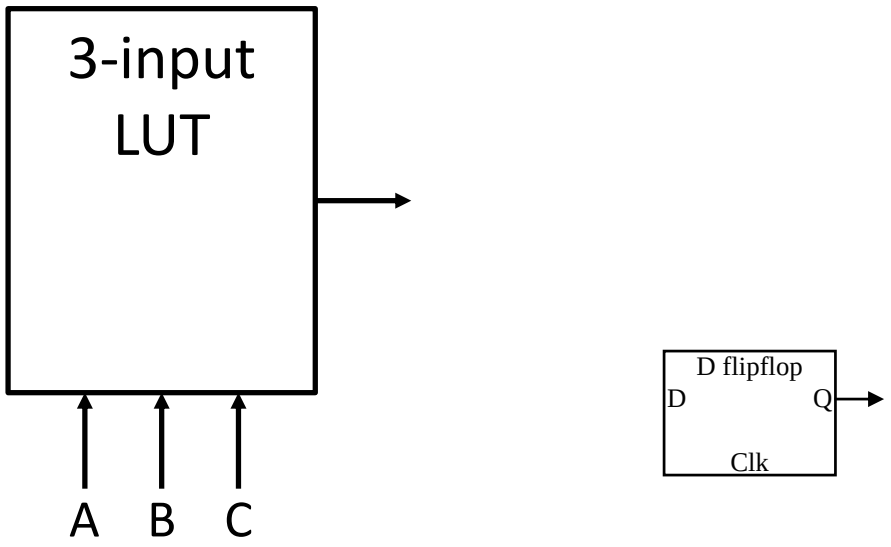
Bitstream



Ⓟ = 1 memory cell (stores 1 bit of info)

FPGA Sequential Logic

- How do we put DFF's onto LUT outputs only when we need them?



- Creates an Logic Cell (or Logic Element)

Cyclone V Adaptive Logic Modules

https://www.altera.com/content/dam/altera-www/global/en_US/pdfs/literature/hb/cyclone-v/cv_5v2.pdf

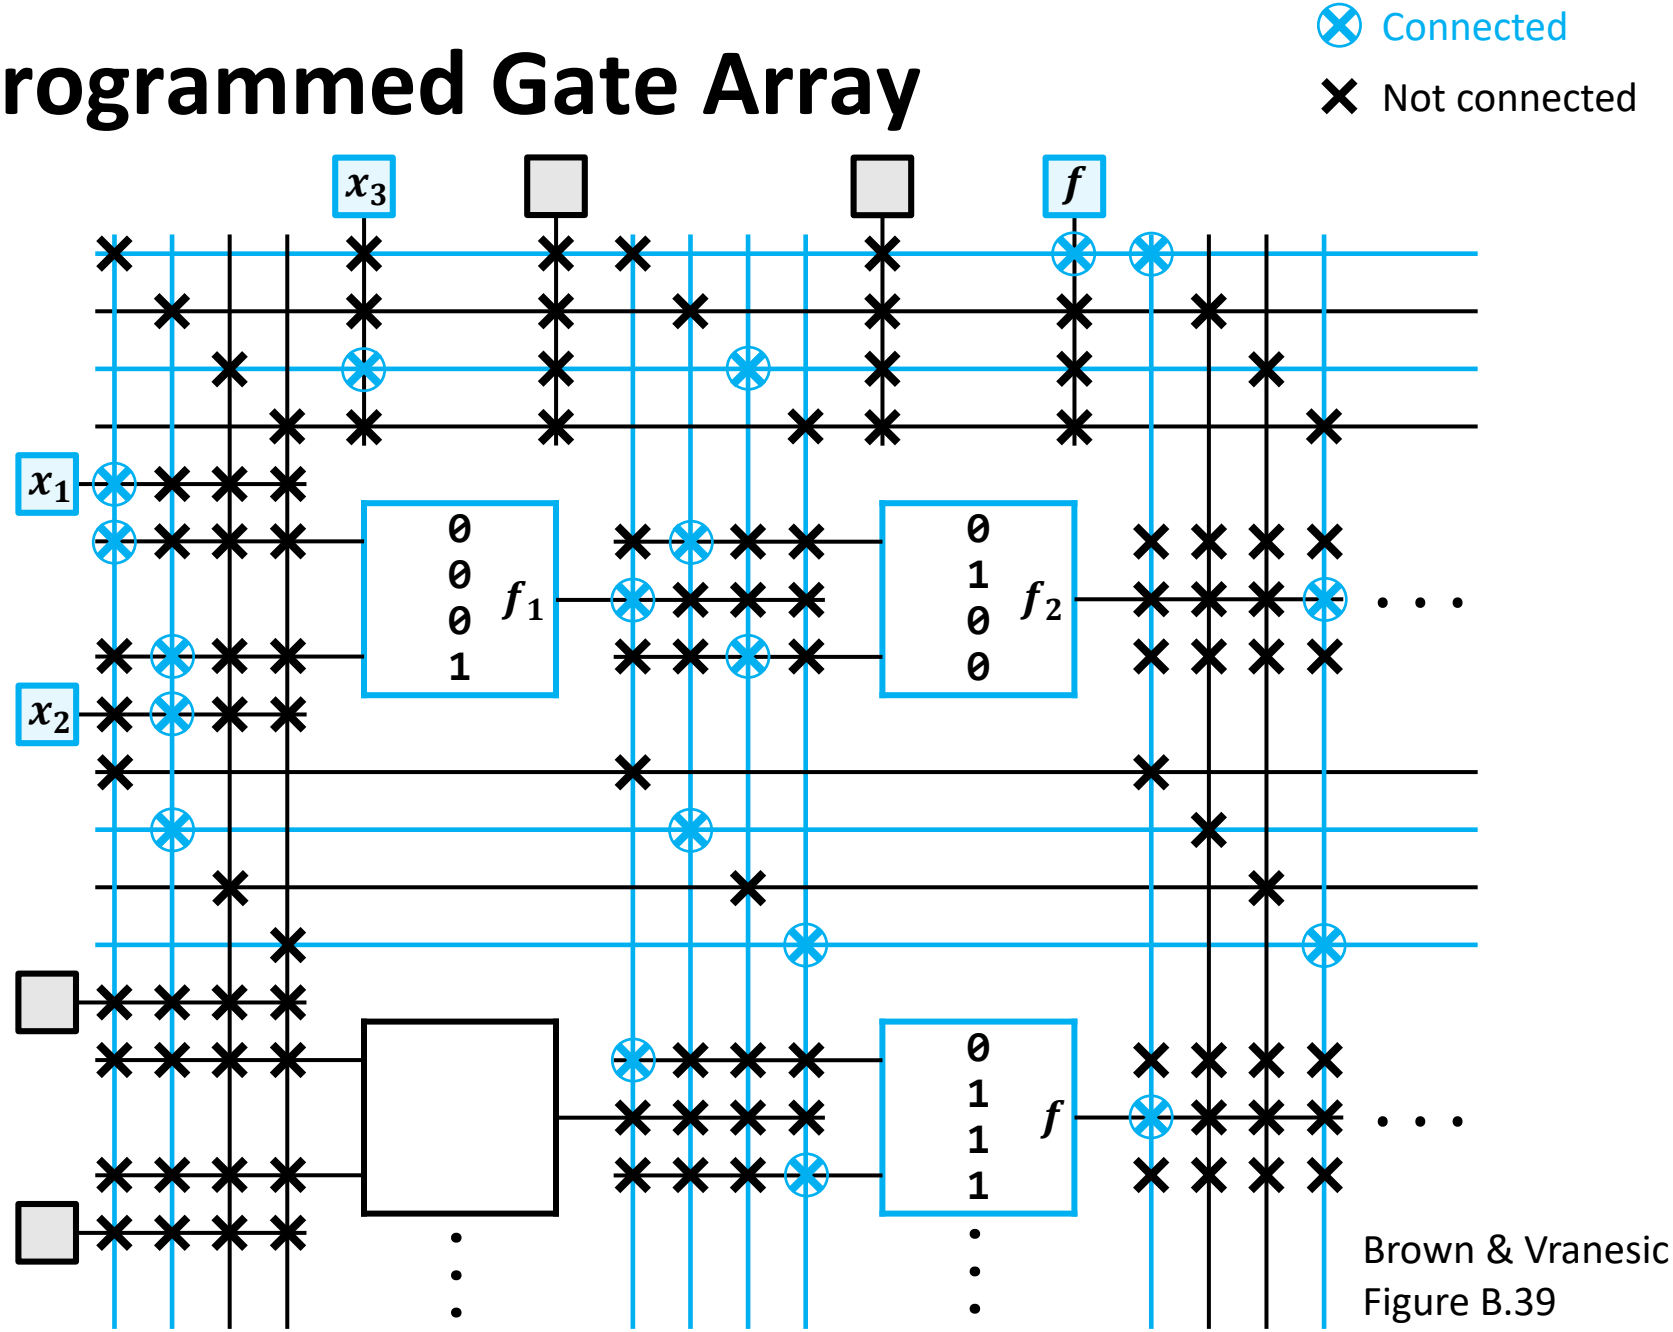
Example Programmed Gate Array



Brown & Vranesic
Figure B.39

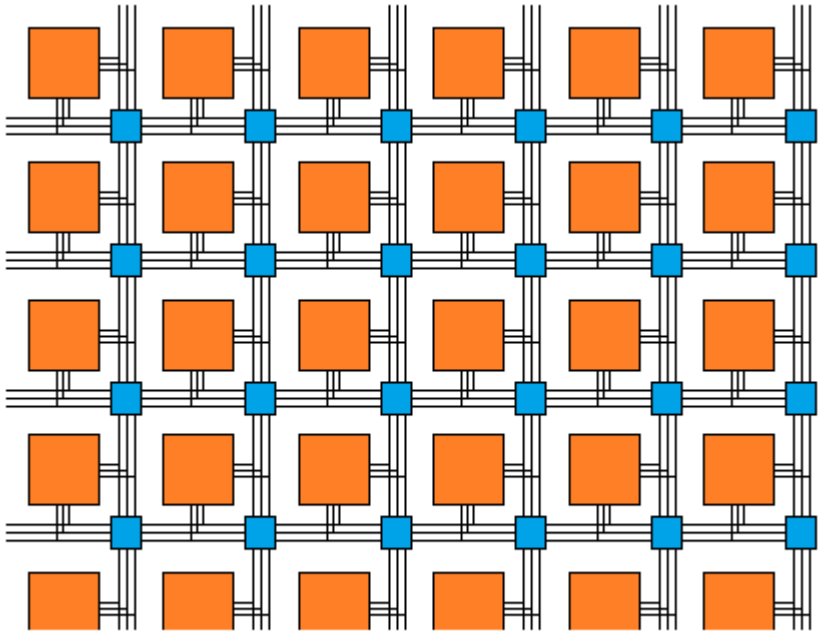
FPGA CAD

- CAD = "Computer-Aided Design"

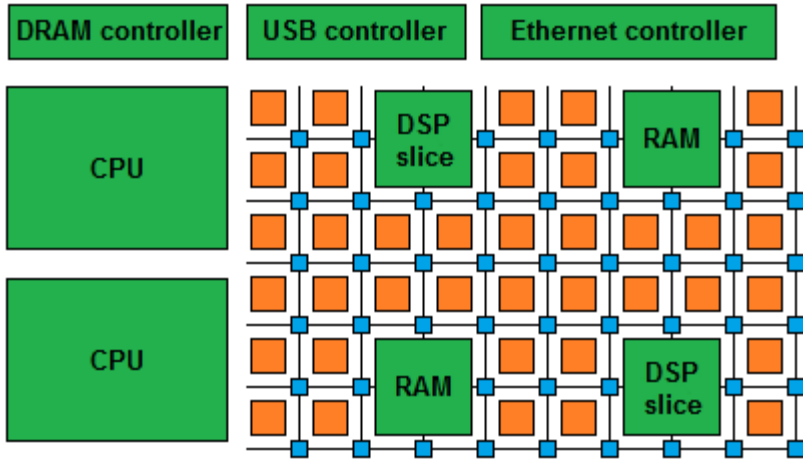
1) **Tech Mapping:** Convert Verilog to LUTs
2) **Placement:** Assign LUTs to specific locations
3) **Routing:** Wire inputs to outputs
4) **Bitstream Generation:** Convert mapping to bits

Gate Array vs. SoC

- SoC = “System on a Chip”

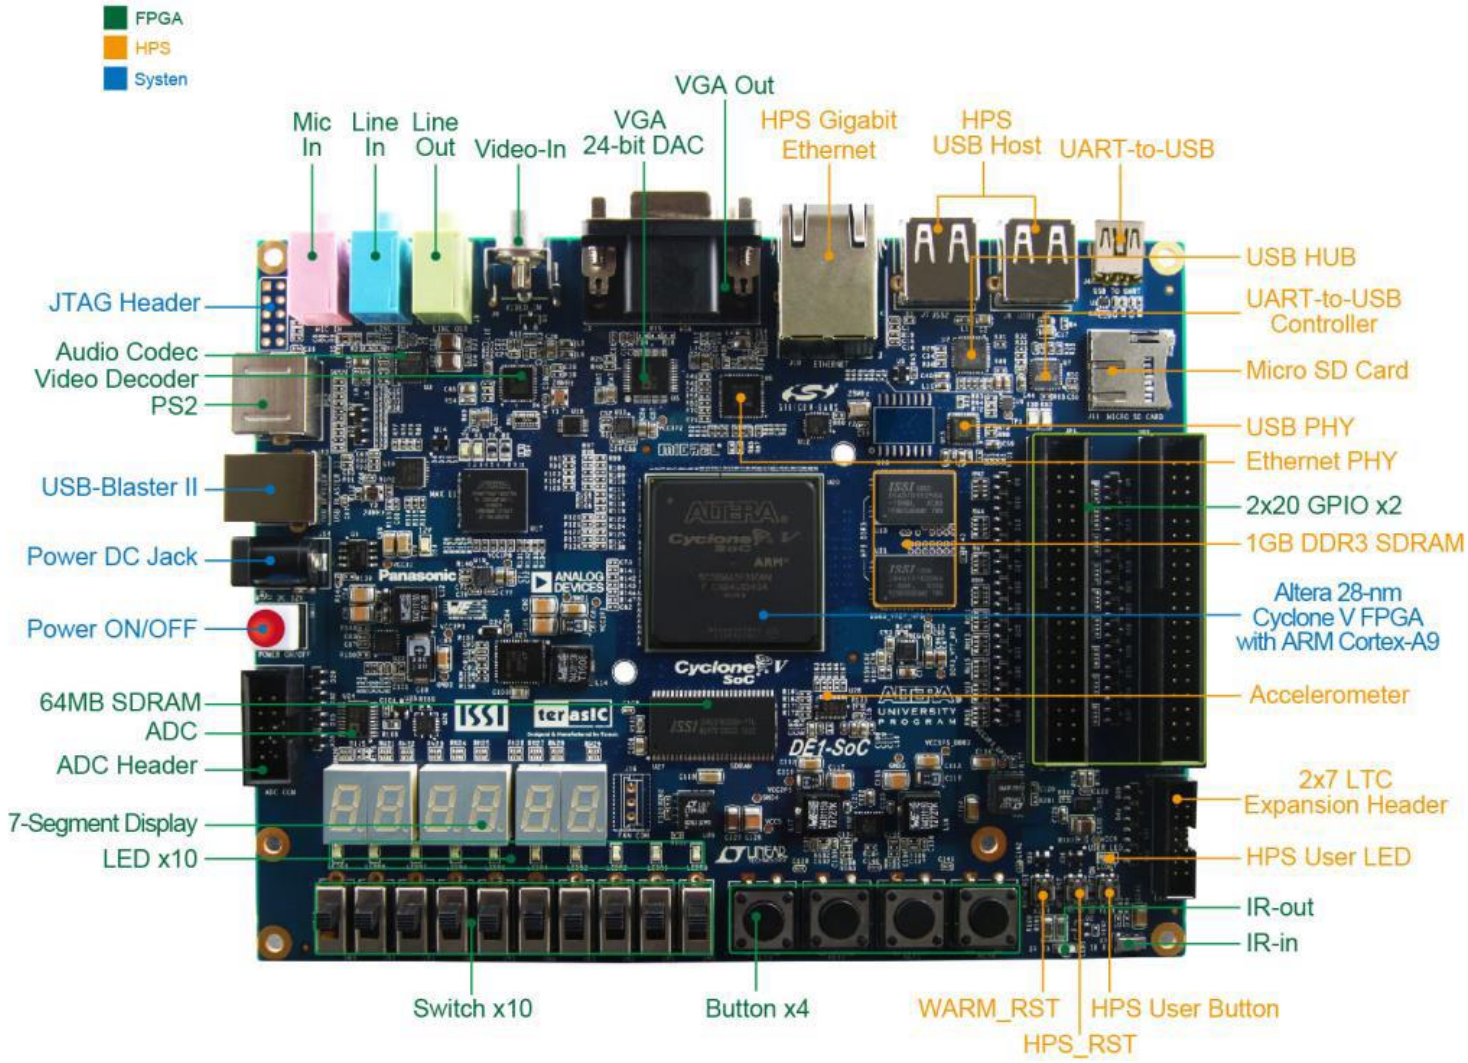


"Clean slate" FPGA: programmable gates and routers

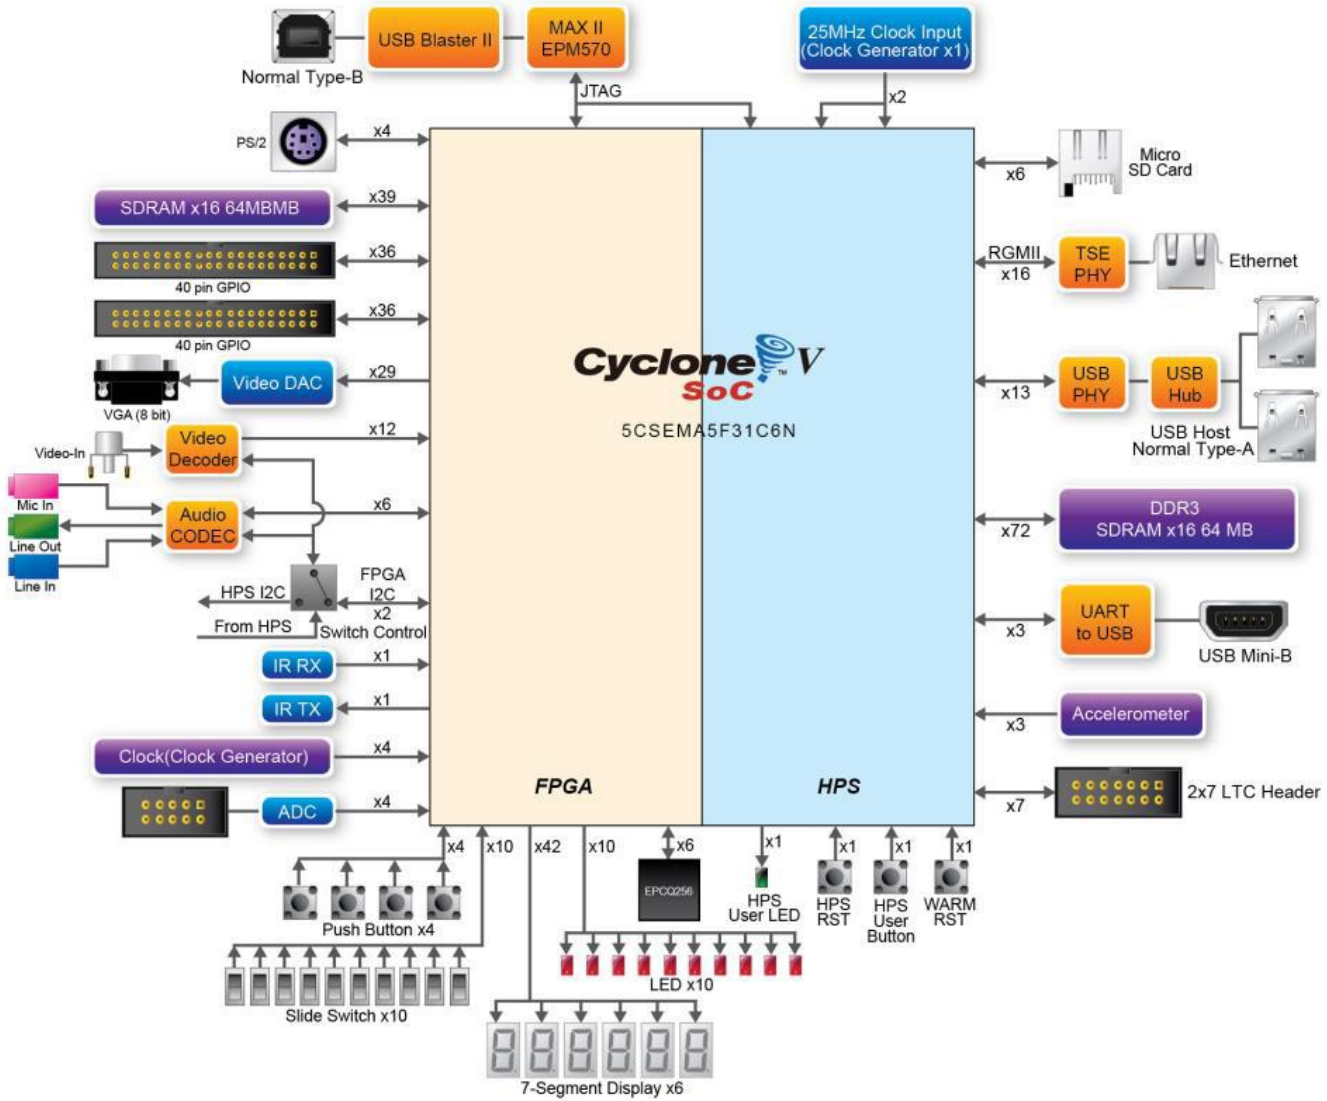


Modern FPGA: lots of hard, not-field-programmable gates

DE1-SoC Board



DE1-SoC Board



FPGAs vs. CPUs

- Individual CPUs designed to handle sequential instruction execution
  - Design and layout determined by architecture
  - Computations "limited" to instruction set
  - Powerful, but also requires things like OS

- FPGAs
  - Programmable, so specially-designed logic for application
    - But can be difficult to specify certain applications
  - Good for parallelizing computations
    - Can perform separate computations if separated via routing

Outline

- Computer Components (Cont.)
  - Register File
  - Datapath teaser
  - Serial Communication
- FPGAs
- **Course Wrap-up**

Course Wrap-Up

- Combinational Logic
  - Karnaugh Maps
- Sequential Logic
  - Timing Considerations
- Finite State Machines
- Routing Elements
  - Multiplexor, Encoder, Decoder, Demultiplexor
- Computational Building Blocks
  - Adders, Registers, Shift Registers, Counters
- *SystemVerilog*

Digital Workhorses

- Multiplexors
  - Logic – can implement arbitrary logic as LUTs
  - Routing – select between many simultaneous computations

- Flip-flops
  - Store information
    - registers, shift registers, counters, FSMs, RAM cells
  - Synchronization of system
    - Delay element – “holds up” information
  - Deal with metastability

Takeaways

- You can do a lot without actually digging into the hardware details!
  - Verilog is programmatic way to generate design hardware
  - High-level view is sufficient for system design in many cases
- … but the hardware details are important
  - Timing especially – synchronization, metastability
  - Bits are always present – resets, unexpected situations
  - Design affects speed, power, size
- A CPU is not required for many applications

Takeaways

- You now know how to design and implement fairly complex digital designs!
  - Could breadboard + wire packages
  - DE1-SoC ($322): http://www.terasic.com.tw/cgi-bin/page/archive.pl?Language=English&No=836

Final Words

- Please fill out course evaluation!
  - Released online next week online; let's improve this class
- Future classes
  - EE 205/215 – details of electronics
  - EE/CSE 371 – digital design techniques and considerations (algorithms, communication, complexity)
  - EE/CSE 469 – computer architecture (CPU design)
- Hope you had fun this quarter!
- Huge thanks to your TAs!
