

# Design of Digital Circuits and Systems Proposal Workshop

**Instructor:** Vikram Iyer

**Teaching Assistants:**

Ariel Kao

Josh Wentzien

Selim Saridede

Jared Yoder

Derek Thorp

Adapted from material by Justin Hisa

# Relevant Course Information

- ❖ Quiz 5 (50 min) is *this* Thursday @ 11:30 am
  - Static Timing Analysis, Pipelining, Clock Domain Crossing
  - Scientific calculator allowed!
- ❖ Homework 6 due Tues (6/3)
- ❖ Lab 6 proposal due tomorrow (5/28)
  - (1) Description of major project features
  - (2) Top-level block diagram
  - (3) Images/sketches of VGA output
- ❖ Lab 6 report and video due 6/9

# Review Questions

- ❖ What is the difference between `rand` & `randc`?
- ❖ How do you randomize an object? What happens when this fails?
- ❖ Define *random stability*.
- ❖ Name a reason one might want to split constraints into multiple constraint blocks.

# Ranges and Sets

- ❖ `[A:B]` declares a **range** of integers between `A` and `B`, inclusive
  - Just like the notation used in array declarations
  - `A` and `B` can be constants and/or variables
- ❖ A random variable can be chosen from a **set** of values using the `inside` keyword
  - Can be used with both `rand` and `randc` variables
  - Sets can be notated as the concatenation of values, ranges, and array variables
  - *e.g.*,

```
rand bit [7:0] f;  
bit [7:0] vals[] = {5, 8, 13};  
constraint c_fib { f inside {[1:3], vals, 21}; }
```

# Weighted Distributions

- ❖ You can define a weighted non-uniform distribution with the constraint expression

```
<var> dist {<distribution>;
```

- Can only be used with `rand` variables
- ❖ Distribution notated in comma-separated list of values and their relative weights
  - Values can be expressed by themselves or in a range or set
  - Weights in distribution become normalized (*i.e.*, don't have to sum to 100)
  - *e.g.*, `constraint c_weight { coin dist {0:=5, 1:=5}; }`

# Weighted Distributions

- ❖ Weight distribution operators for ranges and sets
  - `:` assigns same weight to multiple values
  - `:/` distributes the assigned weight across multiple values
- ❖ Example:

```
constraint c_dist1 {  
  x dist {0:=30,  
          [1:3]:=30};  
}
```

| x | Probability |
|---|-------------|
| 0 |             |
| 1 |             |
| 2 |             |
| 3 |             |

```
constraint c_dist2 {  
  x dist {0:/30,  
          [1:3]:/30};  
}
```

| x | Probability |
|---|-------------|
| 0 |             |
| 1 |             |
| 2 |             |
| 3 |             |

# Constraint Exercise #1

- ❖ Write out a SystemVerilog program that:
  - Defines a class called MemRead that contains an 8-bit random variable data and a 4-bit random variable addr
  - Constrain addr to 3, 4, or 5
  - Construct a MemRead object and randomize it, making sure to check if the randomization succeeded

```
program exercise1;
  class MemRead;
    rand bit [7:0] data;
    rand bit [3:0] addr;
    constraint c-addr {
      addr > 2;
      addr < 6;
    }
  endclass

  MemRead mr;
  initial begin
    mr = new();
    if (!mr.randomize())
      $finish;
  end
endprogram
```

# Constraint Exercise #2

- ❖ Modify your MemRead class from Exercise #1 to have the following updated constraints:
  - Constrain data to always be 5
  - Constrain addr to probabilistically be 4'd0 10% of the time, 4'd15 10% of the time, and between those two the rest of the time

# Constraints with Variables

- ❖ Instead of hardcoding constraints, use variables with default values
  - Avoid magic numbers; code becomes more readable
  - Can change before performing randomization

```
class Packet;  
  rand bit [31:0] length;  
  constraint c_len {  
    length inside [1:100]};  
}  
endclass
```

```
class Packet;  
  rand bit [31:0] length;  
  int max_len = 100;  
  constraint c_len {  
    length inside [1:max_len]};  
}  
endclass
```

# Constraints with Variables

- ❖ Instead of hardcoding constraints, use variables with default values
  - Avoid magic numbers; code becomes more readable
  - Can change before performing randomization

```
class Packet;  
  rand bit [31:0] length;  
  constraint c_len {  
    length inside [1:100]};  
}  
endclass
```

```
class Packet;  
  rand bit [31:0] length;  
  int max_len = 100;  
  constraint c_len {  
    length inside [1:max_len]};  
}
```

```
initial begin  
  Packet p1 = new();  
  p1.max_len = 200;  
  if (!p1.randomize())  
    $finish;  
end
```

# BONUS SLIDES

Implication and Equivalence Operators are included here as additional (and more complex) constraint operators.

You are *not* expected to study or need to use these in the context of this class.

# Implication and Equivalence Operators

## ❖ Implication: $A \rightarrow B$

- Same meaning, but different syntax from assertions!
  - Equivalent to  $(\neg A \vee B)$
- When used in a constraint, the solver will pick values such that the implication holds true

| A | B | $A \rightarrow B$ |
|---|---|-------------------|
| F | F | T                 |
| F | T | T                 |
| T | F | F                 |
| T | T | T                 |

not allowed as part of a valid solution

## ❖ Equivalence: $A \leftrightarrow B$

- Bidirectional implication:  $(A \rightarrow B) \wedge (B \rightarrow A)$ 
  - Equivalent to XNOR
- Possible confusion that  $==$  also sometimes referred to as an “equivalence operator”, but these are different

| A | B | $A \leftrightarrow B$ |
|---|---|-----------------------|
| F | F | T                     |
| F | T | F                     |
| T | F | F                     |
| T | T | T                     |

# Solution Probabilities

```
rand bit x;  
rand bit [1:0] y;
```

| x | y | Probability |
|---|---|-------------|
| 0 | 0 |             |
| 0 | 1 |             |
| 0 | 2 |             |
| 0 | 3 |             |
| 1 | 0 |             |
| 1 | 1 |             |
| 1 | 2 |             |
| 1 | 3 |             |

# Solution Probabilities

```
rand bit x;           // 0, 1
rand bit [1:0] y;     // 00, 01, 10, 11
// unconstrained!
```

| x | y | Probability |
|---|---|-------------|
| 0 | 0 | 1/8         |
| 0 | 1 | 1/8         |
| 0 | 2 | 1/8         |
| 0 | 3 | 1/8         |
| 1 | 0 | 1/8         |
| 1 | 1 | 1/8         |
| 1 | 2 | 1/8         |
| 1 | 3 | 1/8         |

# Implication and Equivalence Examples

```

rand bit x;
rand bit [1:0] y;
constraint c_imp1 {
    (x==0) -> (y==0);
}

```

| x | y | Probability |
|---|---|-------------|
| 0 | 0 |             |
| 0 | 1 |             |
| 0 | 2 |             |
| 0 | 3 |             |
| 1 | 0 |             |
| 1 | 1 |             |
| 1 | 2 |             |
| 1 | 3 |             |

```

rand bit x;
rand bit [1:0] y;
constraint c_imp2 {
    y > 0;
    (x==0) -> (y==0);
}

```

| x | y | Probability |
|---|---|-------------|
| 0 | 0 |             |
| 0 | 1 |             |
| 0 | 2 |             |
| 0 | 3 |             |
| 1 | 0 |             |
| 1 | 1 |             |
| 1 | 2 |             |
| 1 | 3 |             |

# Implication and Equivalence Examples

```

rand bit x;
rand bit [1:0] y;
constraint c_imp1 {
    (x==0) -> (y==0);
}

```

when x is 0, y must be 0

| x | y              | Probability |
|---|----------------|-------------|
| 0 | 0              | 1/2         |
| 0 | 1 <del>x</del> | 0           |
| 0 | 2 <del>x</del> | 0           |
| 0 | 3 <del>x</del> | 0           |
| 1 | 0              | 1/8         |
| 1 | 1              | 1/8         |
| 1 | 2              | 1/8         |
| 1 | 3              | 1/8         |

50%  
total

50%  
total

```

rand bit x;
rand bit [1:0] y;
constraint c_imp2 {
    y > 0;
    (x==0) -> (y==0);
}

```

since y cannot be 0, neither can x

| x | y              | Probability |
|---|----------------|-------------|
| 0 | 0 <del>x</del> | 0           |
| 0 | 1 <del>x</del> | 0           |
| 0 | 2 <del>x</del> | 0           |
| 0 | 3 <del>x</del> | 0           |
| 1 | 0 <del>x</del> | 0           |
| 1 | 1              | 1/3         |
| 1 | 2              | 1/3         |
| 1 | 3              | 1/3         |

# Implication and Equivalence Examples

```

rand bit x;
rand bit [1:0] y;
constraint c_eqv1 {
    (x==0)<->(y==0);
} // pick x first
  
```

| x | y | Probability |
|---|---|-------------|

# Technology Break

# Lab 6 Proposal Workshop

## ❖ Rough schedule:

- Pairing 1: 11:20 – 11:35
- Pairing 2: 11:35 – 11:50
- Pairing 3: 11:50 – 12:05
- Pairing 4: 12:05 – 12:20

## ❖ Notes:

- Make sure that you introduce and talk about *both* projects
- Be curious – ask questions!
  - Clarifications, point out potential issues, dive into implementation details
- Course staff will be circling to listen in and answer questions
