

Basics on Pointers

CSE 373
Data Structures
Lecture 2

Basic Types and Arrays

- Basic Types
 - › integer, real (floating point), boolean (0,1), character

- Arrays

- › A[0..99] : integer array

10/2/02

Basics on Pointers - Lecture 2

2

Records and Pointers

- Record (also called a struct)

- › Group data together that are related

- › To access the fields we use "dot" notation.

X.real_part
X.imaginary_part

10/2/02

Basics on Pointers - Lecture 2

3

Record Definition

- Record definition creates a new type

Definition

```
record complex : (  
  real_part : real,  
  imaginary_part : real  
)
```

Use in a declaration

```
X : complex
```

10/2/02

Basics on Pointers - Lecture 2

4

Pointer

- A pointer is a reference to a variable or record (or object in Java world).

- In C, if X is of type pointer to Y then *X is of type Y

10/2/02

Basics on Pointers - Lecture 2

5

Creating a Record

- We use the "new" operator to create a record.

P : pointer to blob;

P [] (null pointer)

P := new blob;

10/2/02

Basics on Pointers - Lecture 2

6

Simple Linked List

- A linked list
 - Group data together in a flexible, dynamic way.
 - We'll describe several list ADTs later.

10/2/02

Basics on Pointers - Lecture 2

7

Sparse Polynomials

$$10 + 4x^2 + 20x^{40} + 8x^{86}$$

```

record poly : (
  exp : integer,
  coef : integer,
  next : poly pointer
)
    
```

10/2/02

Basics on Pointers - Lecture 2

8

Identically Zero Polynomial

P → null pointer

10/2/02

Basics on Pointers - Lecture 2

9

Addition of Polynomials

$$10 + 4x^2 + 20x^{40} + 8x^{86}$$

$$7x + 10x^2 - 8x^{86}$$

10/2/02

Basics on Pointers - Lecture 2

10

Recursive Addition

```

Add(P, Q : poly pointer): poly pointer{
  R : poly pointer
  case {
    P = null : R := Q ;
    Q = null : R := P ;
    P.exp < Q.exp : R := P ;
                    R.next := Add(P.next, Q);
    P.exp > Q.exp : R := Q ;
                    R.next := Add(P, Q.next);
    P.exp = Q.exp : R := P ;
                    R.coef := P.coef + Q.coef ;
                    R.next := Add(P.next, Q.next);
  }
  return R
}
    
```

17

Notes on Addition

- Addition is destructive, that is, the original polynomial are gone after the operation.
- We don't salvage "garbage" nodes. We'll talk about this later.
- We don't consider consider the case when the coefficients cancel. We'll talk about that later.

10/2/02

Basics on Pointers - Lecture 2

18

Unneeded to Garbage

- Class participation
- How would you force the unneeded node to be garbage in the code on slide 11?

10/2/02

Basics on Pointers - Lecture 2

19

Memory Management – Private Store

- Private store – get blocks from a private store when possible and return them when done.
 - + Efficiently uses blocks of a specific size
 - The list of unused blocks can build up eventually using too much memory.

10/2/02

Basics on Pointers - Lecture 2

20

Private Store

10/2/02

Basics on Pointers - Lecture 2

21

Private Store

10/2/02

Basics on Pointers - Lecture 2

22

Memory Management – Global Allocator

- Global Allocator's store – always get and return blocks to global allocator
 - + Necessary for dynamic memory.
 - + Blocks of various sizes can be merged if they reside in contiguous memory.
 - Allocator may not handle blocks of different sizes well.
 - Allocator may be slower than a private store.

10/2/02

Basics on Pointers - Lecture 2

23

Memory Management – Garbage Collection

- Garbage collection – run time system recovers inaccessible blocks from time-to-time. Used in Lisp, Smalltalk, Java.
 - + No need to return blocks to an allocator or keep them in a private store.
 - Care must be taken to make unneeded blocks inaccessible.
 - When garbage collection kicks in there may be undesirable response time.

10/2/02

Basics on Pointers - Lecture 2

24

Solution to Class Work

```
P.exp = Q.exp : R := P ;
    R.coef := P.coef + Q.coef ;
    if R.coef = 0 then
        R := Add(P.next,Q.next);
    else
        R.next := Add(P.next,Q.next);
}
```

10/2/02

Basics on Pointers - Lecture 2

25

Use of Private Store or Global Allocator

```
P.exp = Q.exp : R := P ;
    R.coef := P.coef + Q.coef ;
    if R.coef = 0 then
        R := Add(P.next,Q.next);
        Free(P); Free(Q);
    else
        R.next := Add(P.next,Q.next);
        Free(Q);
}
```
