Graph Terminology & Representation

CSE 373 Data Structures Winter 2007

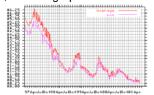

Reading

- · Reading Chapter 9
 - > Sections 9.1

Graph Terminology

What are graphs?

• Yes, this is a graph....

· But we are interested in a different kind of "graph"

Graph Terminology

Graphs

- · Graphs are composed of
 - › Nodes (vertices)
 - › Edges (arcs)

Graph Terminology

Varieties

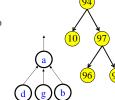

- Nodes
 - › Labeled or unlabeled
- Edges
 - › Directed or undirected
 - › Labeled or unlabeled

Graph Terminology

Motivation for Graphs

- Consider the data structures we have looked at so far...

 <u>Linked list</u>: nodes with 1 incoming edge + 1 outgoing edge
- Binary trees/heaps: nodes with 1 incoming edge + 2 outgoing edges
- B-trees: nodes with 1 incoming edge + multiple outgoing edges
- <u>Up-trees</u>: nodes with multiple incoming edges + 1 outgoing edge

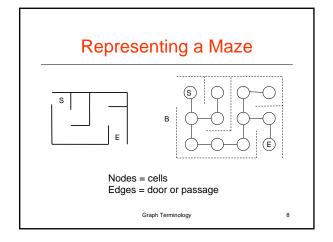

Value Next

node Value Next

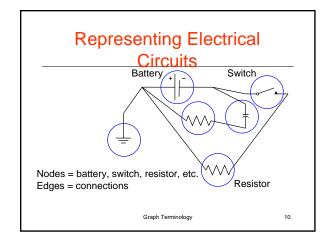

Motivation for Graphs

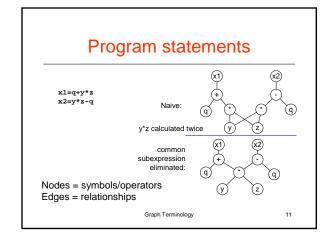

- How can you generalize these data structures?
- Consider data structures for representing the following problems...

Colorings Fragh Terminology 25

Four Color Conjecture

- is it true that any map can be colored using four colors in such a way that adjacent regions (i.e. those sharing a common boundary segment, not just a point) receive different colors (1852)?
- · Many attempts at proof
- Finally "solved" by computer program (1974)
 - > Still extremely complex....

Graph Terminology

. . .

"We should mention that both our programs use only integer arithmetic, and so we need not be concerned with round-off errors and similar dangers of floating point arithmetic. However, an argument can be made that our 'proof' is not a proof in the traditional sense, because it contains steps that car never be verified by humans. In particular, we have not proved the correctness of the compiler we compiled our programs on, nor have we proved the infallibility of the hardware we ran our programs on. These have to be taken on faith, and are conceivably a source of error. However, from a practical point of view, the chance of a computer error that appears consistently in exactly the same way on all runs of our programs on all the compilers under all the operating systems that our programs run on is infinitesimally small compared to the chance of a human error during the same amount of case-checking. Apart from this hypothetical possibility of a computer consistently giving an incorrect answer, the rest of our proof can be verified in the same way as traditional mathematical proofs. We concede, however, that verifying a computer program is much more difficult than checking a mathematical proof of the same length.'

Graph Terminology

27

Graph Definition

- A graph is a collection of nodes plus edges
 - Linked lists, trees, and heaps are all special cases of graphs
- The nodes are known as vertices (node = "vertex")
- Formal Definition: A graph G is a pair (V, E) where
 - V is a set of vertices or nodes
 - E is a set of edges that connect vertices

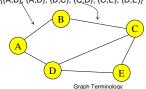

Graph Terminology

20

Graph Example

- Here is a graph G = (V, E)
 - Each edge is a pair (v₁, v₂), where v₁, v₂ are vertices in V
 - $V = \{A, B, C, D, E, F\}$

 $E = \{(A,B), (A,D), (B,C), (C,D), (C,E), (D,E)\}$

29

Directed vs Undirected Graphs

 If the order of edge pairs (v₁, v₂) matters, the graph is directed (also called a digraph): (v₁, v₂) ≠ (v₂, v₁)

If the order of edge pairs (v₁, v₂) does not matter, the graph is called an undirected graph: in this case, (v₁, v₂) = (v₂, v₁)

Graph Terminology

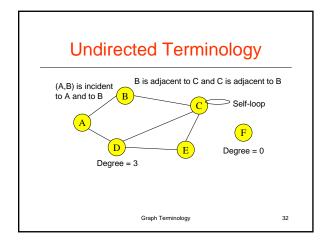

30

Undirected Terminology

- Two vertices u and v are adjacent in an undirected graph G if {u,v} is an edge in G
 - > edge e = {u,v} is incident with vertex u and vertex
 v
- The degree of a vertex in an undirected graph is the number of edges incident with it
 - a self-loop counts twice (both ends count)
 - denoted with deg(v)

Graph Terminology

31

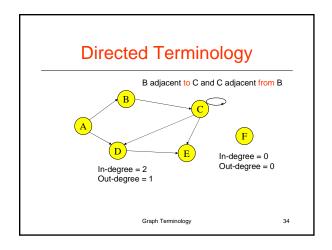

Directed Terminology

- Vertex u is adjacent to vertex v in a directed graph G if (u,v) is an edge in G
 - > vertex u is the initial vertex of (u,v)
- · Vertex v is adjacent from vertex u
 - › vertex v is the terminal (or end) vertex of (u,v)
- Degree
 - in-degree is the number of edges with the vertex as the terminal vertex
 - out-degree is the number of edges with the vertex as the initial vertex

Graph Terminology

33

Handshaking Theorem

- Let G=(V,E) be an undirected graph with |E|=e edges
- Then $2e = \sum deg(v)$
- Every edge contributes +1 to the degree of each of the two vertices it is incident with
 - number of edges is exactly half the sum of deg(v)
 - > the sum of the deg(v) values must be even

Graph Terminology

35

Handshaking Theorem II

• For a directed graph:

$$\sum_{v in \, G} ind(v) = \sum_{v \, in \, g} outd(v) = e$$

Graph Terminology

ology 3

Graph ADT

- · Nothing unexpected
 - > Build the graph (vertices, edges)
 - Return the edges incident in(or out) of a vertex)
 - > Find if two vertices are adjacent etc..
 - › Replace ..., Insert...Remove ...
- · What is interesting
 - > How to represent graphs in memory
 - > What representation to use for what algorithms

Graph Terminology

37

Graph Representations

- Space and time are analyzed in terms of:
 - Number of vertices = |V| and
 - Number of edges = |E|
- There are at least two ways of representing graphs:
 - The adjacency matrix representation
 - The *adjacency list* representation
