# M-ary Search Tree

- Maximum branching factor of M
- Complete tree has height =

# disk accesses for find:

Runtime of *find*:

05/09/2008

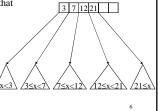

# Solution: B-Trees

- specialized M-ary search trees
- Each **node** has (up to) M-1 keys:
  - subtree between two keys x and y contains leaves with *values* v such that

• Pick branching factor M such that each node takes one full {page, block}

of memory

 $x \le v < y$ 

### **B-Trees**

What makes them disk-friendly?

### 1. Many keys stored in a node

- All brought to memory/cache in one access!
- 2. Internal nodes contain *only* keys;
  Only leaf nodes contain keys and actual *data* 
  - The tree <u>structure</u> can be loaded into memory irrespective of data object size
  - · Data actually resides in disk

05/09/2008

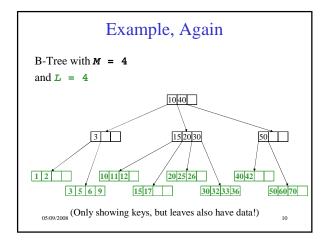

B-Tree: Example B-Tree with M = 4 (# pointers in internal node) (# data items in Leaf) and L = 410 40 3 15 20 30 50 10 11 12 20 25 26 3 5 6 9 15 17 30 32 33 36 50 60 70 Data objects, that I'll ignore in slides Note: All leaves at the same depth!

# B-Tree Properties ‡

- Data is stored at the leaves
- All leaves are at the same depth and contain between  $\lceil L/2 \rceil$  and L data items
- Internal nodes store up to M-1 keys
- Internal nodes have between  $\lceil M/2 \rceil$  and M children
- Root (special case) has between 2 and M children (or root could be a leaf)

05/09/2008

‡These are technically B+-Trees

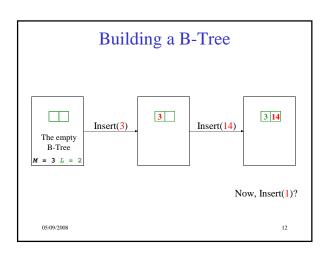

### B-trees vs. AVL trees

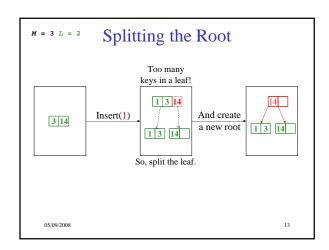

Suppose we have 100 million items (100,000,000):

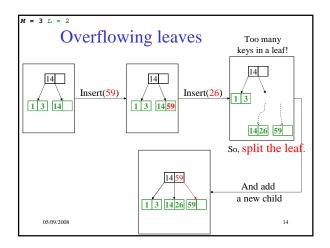

- Depth of AVL Tree
- Depth of B+ Tree with M = 128, L = 64

11

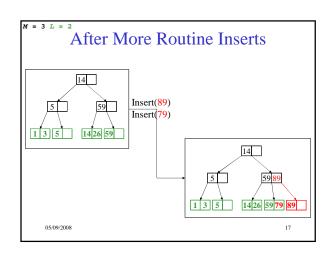

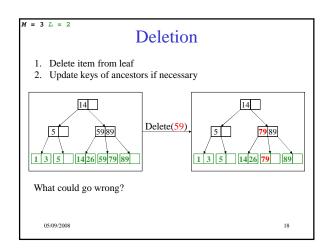

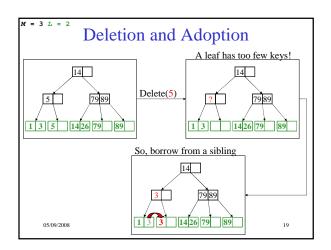

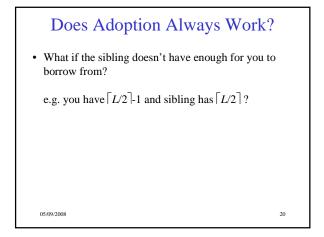

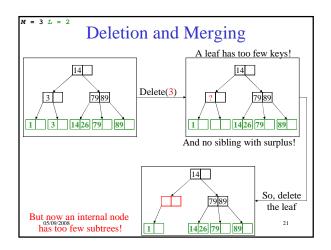

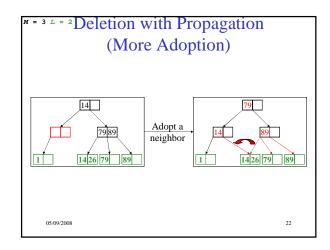

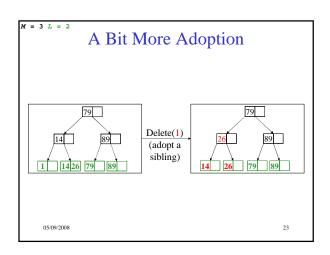

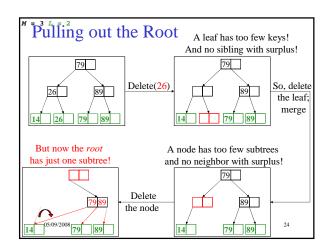

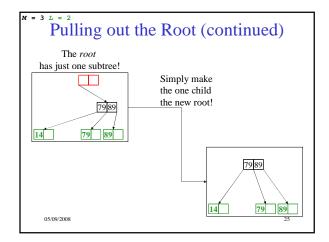

# **Deletion Algorithm**

- 1. Remove the key from its leaf
- 2. If the leaf ends up with fewer than [L/2] items, underflow!
  - Adopt data from a sibling; update the parent
  - If adopting won't work, delete node and merge with neighbor
  - If the parent ends up with fewer than [m/2] items, underflow!

26

# **Deletion Slide Two**

- 3. If an internal node ends up with fewer than  $\lceil M/2 \rceil$  items, underflow!
  - Adopt from a neighbor; update the parent
  - If adoption won't work, merge with neighbor
  - If the parent ends up with fewer than [M/2] items, underflow!
- 4. If the root ends up with only one child, make the child the new root of the tree

This reduces the height of the tree!

27

# Thinking about B-Trees

- B-Tree insertion can cause (expensive) splitting and propagation
- · B-Tree deletion can cause (cheap) adoption or (expensive) deletion, merging and propagation
- Propagation is rare if **M** and **L** are large (Whv?)
- If M = L = 128, then a B-Tree of height 4 will store at least 30,000,000 items

05/09/2008 28

# Tree Names You Might Encounter

### FYI:

- B-Trees with M = 3, L = x are called 2-3 trees
  - · Nodes can have 2 or 3 pointers
- B-Trees with M = 4, L = x are called 2-3-4 trees
  - Nodes can have 2, 3, or 4 pointers
