

Graphs: More on Shortest Paths, Plus Minimum Spanning Trees

CSE 373
Data Structures and Algorithms

Today's Outline

- Announcements
 - Homework #5 – due Thurs June 4
- Graphs
 - Shortest Paths Algorithms
 - Minimum Spanning Tree

5/27/09

2

Correctness: The Cloud Proof

- How does Dijkstra's decide which vertex to add to the Known set next?
- If path to **v** is shortest, path to **w** must be *at least as long* (or else we would have picked **w** as the next vertex)
 - So the path through **w** to **v** cannot be any shorter!

5/27/09

3

Correctness: Inside the Cloud

Prove by induction on # of nodes in the cloud:

Initial cloud is just the source with shortest path 0

Assume: Everything inside the cloud has the correct shortest path

Inductive step: Only when we prove the shortest path to some node **v** (which is not in the cloud) is correct, we add it to the cloud

When does Dijkstra's algorithm not work?

5/27/09

4

Dijkstra's vs BFS

At each step:

- 1) Pick closest unknown vertex
- 2) Add it to finished vertices
- 3) Update distances

Dijkstra's Algorithm

At each step:

- 1) Pick vertex from queue
- 2) Add it to visited vertices
- 3) Update queue with neighbors

Breadth-first Search

Some Similarities:

5/27/09

5

The Trouble with Negative Weight Cycles

What's the shortest path from A to E?

Problem?

5/27/09

6

Minimum Spanning Trees

Given an undirected graph $G=(V,E)$, find a graph

$G'=(V, E')$ such that:

- E' is a subset of E
- $|E'| = |V| - 1$
- G' is connected
- $\sum_{(u,v) \in E'} c_{uv}$ is minimal

G' is a **minimum spanning tree.**

$$\sum_{(u,v) \in E'} c_{uv}$$

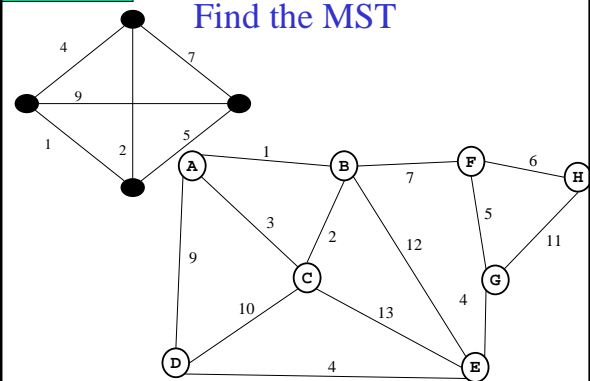

Applications: wiring a house, power grids, Internet connections

5/27/09

7

Student Activity

Find the MST

5/27/09

8

Two Different Approaches

Prim's Algorithm

Almost identical to Dijkstra's

Kruskals's Algorithm

Completely different!

5/27/09

9

Prim's algorithm

Idea: Grow a tree by adding an edge from the "known" vertices to the "unknown" vertices. Pick the edge with the smallest weight.

5/27/09

10

Prim's Algorithm for MST

A **node-based greedy algorithm**
Builds MST by greedily adding nodes

1. Select a node to be the "root"
 - mark it as known
 - Update cost of all its neighbors
2. While there are unknown nodes left in the graph
 - a. Select an unknown node b with the smallest cost from some known node a
 - b. Mark b as known
 - c. Add (a, b) to MST
 - d. Update cost of all nodes adjacent to b

5/27/09

11

Student Activity

Start with V_1

Find MST using Prim's

V	Kwn	Distance	path
v1			
v2			
v3			
v4			
v5			
v6			
v7			

Order Declared Known:
 V_1

5/27/09

12

Prim's Algorithm Analysis

Running time:

Same as Dijkstra's: $O(|E| \log |V|)$

Correctness:

Proof is similar to Dijkstra's

5/27/09

13

Kruskal's MST Algorithm

Idea: Grow a **forest** out of edges that do not create a cycle. Pick an edge with the smallest weight.

$G=(V,E)$

5/27/09

14

Kruskal's Algorithm for MST

An edge-based greedy algorithm

Builds MST by greedily adding edges

1. Initialize with
 - empty MST
 - all vertices marked unconnected
 - all edges unmarked
2. While there are still unmarked edges
 - a. Pick the lowest cost edge (u,v) and mark it
 - b. If u and v are not already connected, add (u,v) to the MST and mark u and v as connected to each other

Doesn't it sound familiar?

5/27/09

15

Kruskal code

```
void Graph::kruskal(){
    int edgesAccepted = 0;
    DisjSet s(NUM_VERTICES);

    while (edgesAccepted < NUM_VERTICES - 1){
        e = smallest weight edge not deleted yet;
        // edge e = (u, v)
        uset = s.find(u);
        vset = s.find(v);
        if (uset != vset){
            edgesAccepted++;
            s.unionSets(uset, vset);
        }
    }
}
```

Annotations:

- $|E|$ heap ops (points to the while loop)
- $2|E|$ finds (points to the two find operations)
- $|V|$ unions (points to the unionSets operation)

5/27/09

16

Student Activity

Find MST using Kruskal's

Total Cost:

- Now find the MST using Prim's method.
- Under what conditions will these methods give the same result?

5/27/09
