

# Binary Search Trees

CSE 373  
Data Structures & Algorithms  
Ruth Anderson  
Spring 2010

## Today's Outline

- **Announcements**
  - Assignment #2 due Fri, April 16, posted
- **Today's Topics:**
  - Asymptotic Analysis
  - Binary Search Trees

4/09/10

2

## Tree Calculations

Recall: height is max number of edges from root to a leaf

Find the height of the tree...

runtime:

4/09/10

4

## Tree Calculations Example

How high is this tree?

4/09/10

5

## More Recursive Tree Calculations: Tree Traversals

A *traversal* is an order for visiting all the nodes of a tree

(an expression tree)

Three types:

- Pre-order: Root, left subtree, right subtree
- In-order: Left subtree, root, right subtree
- Post-order: Left subtree, right subtree, root

4/09/10

6

## Traversals

```
void traverse(BNode t){  
    if (t != NULL)  
        traverse (t.left);  
        print t.element;  
        traverse (t.right);  
    }  
}
```

Which one is this?

4/09/10

7

## Binary Trees

- Binary tree is
  - a root
  - left subtree (*maybe empty*)
  - right subtree (*maybe empty*)
- Representation:

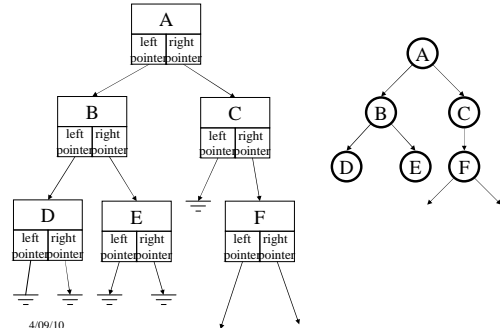

Data	
left pointer	right pointer

4/09/10

8

## Binary Tree: Representation

4/09/10

9

## Binary Tree: Special Cases

4/09/10

10

## ADTs Seen So Far

- Stack
  - Push
  - Pop
- Queue
  - Enqueue
  - Dequeue

4/09/10

11

## The Dictionary ADT

- Data:
  - a set of (key, value) pairs
- Operations:
  - Insert (key, value)
  - Find (key)
  - Remove (key)

insert(rea, ...)

find(sysliu)

The Dictionary ADT is sometimes called the "Map ADT"

4/09/10

12

## A Modest Few Uses

- Sets
- Dictionaries
- Networks : Router tables
- Operating systems : Page tables
- Compilers : Symbol tables

**Probably the most widely used ADT!**

4/09/10

13

## Implementations

insert find delete

- Unsorted Linked-list
- Unsorted array
- Sorted array

4/09/10

14

## Binary Search Tree Data Structure

- Structural property
  - each node has  $\leq 2$  children
  - result:
    - storage is small
    - operations are simple
    - average depth is small
- Order property
  - all keys in left subtree smaller than root's key
  - all keys in right subtree larger than root's key
  - result: easy to find any given key

4/09/10

15

## Are these BSTs?

4/09/10

16

Activity

## Find in BST, Recursive

```
Node Find(Object key,
          Node root) {
    if (root == NULL)
        return NULL;
    if (key < root.key)
        return Find(key,
                    root.left);
    else if (key > root.key)
        return Find(key,
                    root.right);
    else
        return root;
}
```

Runtime:

4/09/10

17

## Find in BST, Iterative

```
Node Find(Object key,
          Node root) {
    while (root != NULL &&
           root.key != key) {
        if (key < root.key)
            root = root.left;
        else
            root = root.right;
    }
    return root;
}
```

Runtime:

4/09/10

18

## Insert in BST

Insert(13)  
Insert(8)  
Insert(31)

Runtime:

4/09/10

19

## BuildTree for BST

- Suppose keys 1, 2, 3, 4, 5, 6, 7, 8, 9 are inserted into an initially empty BST.

**Runtime depends on the order!**

- in given order
- in reverse order
- median first, then left median, right median, etc.

4/09/10

20

## Bonus: FindMin/FindMax

- Find minimum

- Find maximum

4/09/10

21

## Deletion in BST

Why might deletion be harder than insertion?

4/09/10

22

## Lazy Deletion

Instead of physically deleting nodes, just mark them as deleted

- + simpler
- + physical deletions done in batches
- + some adds just flip deleted flag

- extra memory for deleted flag
- many lazy deletions slow finds
- some operations may have to be modified (e.g., min and max)

4/09/10

23

## Non-lazy Deletion

- Removing an item disrupts the tree structure.
- Basic idea: **find** the node that is to be removed. Then “fix” the tree so that it is still a binary search tree.
- Three cases:
  - node has no children (leaf node)
  - node has one child
  - node has two children

4/09/10

24

## Non-lazy Deletion – The Leaf Case

Delete(17)

4/09/10

25

## Deletion – The One Child Case

Delete(15)

4/09/10

26

## Deletion – The Two Child Case

Delete(5)

What can we replace 5 with?

4/09/10

27

## Deletion – The Two Child Case

Idea: Replace the deleted node with a value guaranteed to be between the two child subtrees!

Options:

- *succ* from right subtree:  $\text{findMin}(t.\text{right})$
- *pred* from left subtree :  $\text{findMax}(t.\text{left})$

Now delete the original node containing *succ* or *pred*

- Leaf or one child case – easy!

4/09/10

28

## Finally...

7 replaces 5

Original node containing 7 gets deleted

4/09/10

29

## Balanced BST

### Observation

- BST: the shallower the better!
- For a BST with  $n$  nodes
  - Average height is  $\Theta(\log n)$
  - Worst case height is  $\Theta(n)$
- Simple cases such as  $\text{insert}(1, 2, 3, \dots, n)$  lead to the worst case scenario

### Solution: Require a **Balance Condition** that

1. ensures depth is  $\Theta(\log n)$  – strong enough!
2. is easy to maintain – not too strong!

4/09/10

30

## Potential Balance Conditions

1. Left and right subtrees of the root have equal number of nodes
2. Left and right subtrees of the root have equal *height*

4/09/10

31

## Potential Balance Conditions

3. Left and right subtrees of *every node* have equal number of nodes
  
4. Left and right subtrees of *every node* have equal *height*
