Lecture 3: Maps and Iterators

CSE 373: Data Structures and Algorithms

5 Minutes

Warm Up – Design Decisions

Discuss with your neighbors: Which implementation of which ADT would you choose if asked to implement each of the following situations? For each consider the most important functions to optimize.

Situation #1: Syntax checker to determined correct alignment of Java code curly braces

LinkedStack – optimize for "sandwich" pattern of closing most recent sets first and possible reordering during development

Situation #2: Scheduling print jobs sent to a single printer by multiple users

ArrayQueue – optimize for maintaining order of requests received, possible cancellations and adhering to maximum queue size

Situation #3: The collection of comments left by users on a single Instagram post

ArrayList – optimize for addition in order, the ability to remove regardless of position and update number of likes

Discussion Board posted

HW 1 posted, due Friday Jan 18

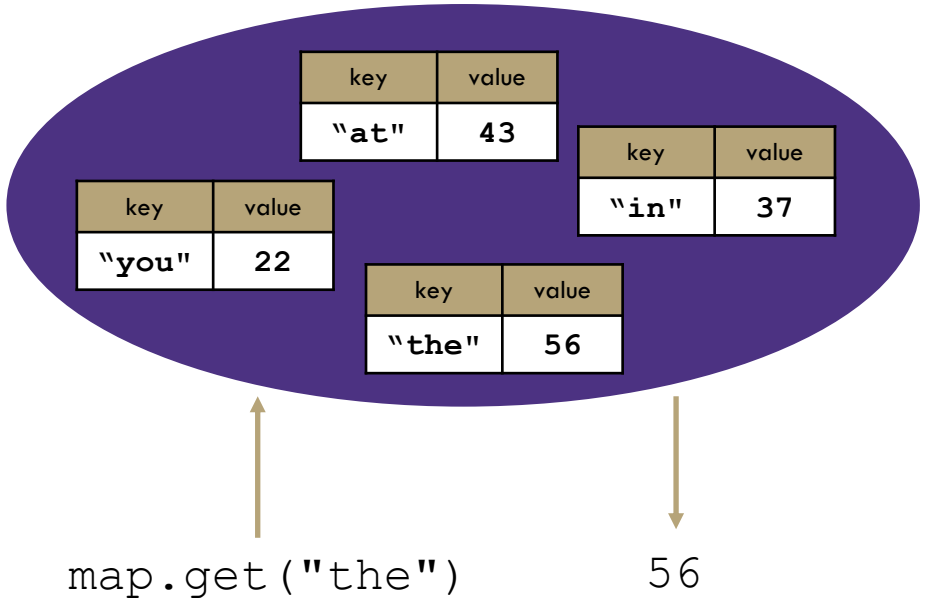
Office Hours start next week

Sorry, still no add code

Review: Maps

map: Holds a set of unique *keys* and a collection of *values*, where each key is associated with one value.

- a.k.a. "dictionary", "associative array", "hash"



Dictionary ADT

state

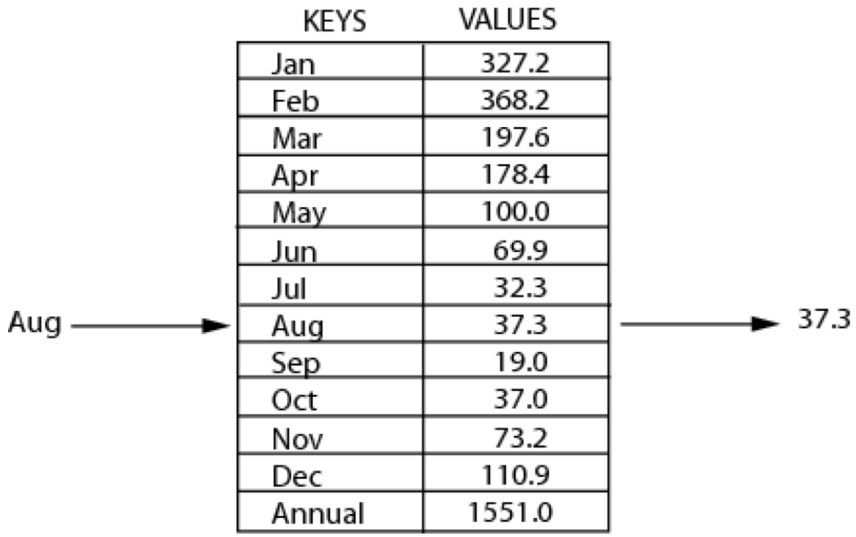
Set of items & keys
Count of items

behavior

put(key, item) add item to collection indexed with key
get(key) return item associated with key
containsKey(key) return if key already in use
remove(key) remove item and associated key
size() return count of items

supported operations:

- **put**(*key*, *value*): Adds a given item into collection with associated key, if the map previously had a mapping for the given key, old value is replaced
- **get**(*key*): Retrieves the value mapped to the key
- **containsKey**(key): returns true if key is already associated with value in map, false otherwise
- **remove**(*key*): Removes the given key and its mapped value



2 Minutes

Implementing a Dictionary with an Array

Dictionary ADT

state

Set of items & keys
Count of items

behavior

put(key, item) add item to collection indexed with key
get(key) return item associated with key
containsKey(key) return if key already in use
remove(key) remove item and associated key
size() return count of items

ArrayDictionary<K, V>

state

```
Pair<K, V>[] data
size
```

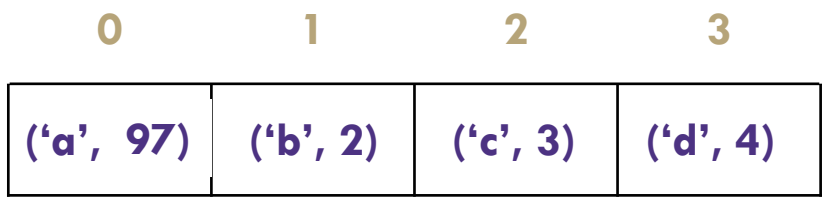
behavior

```
put create new pair, add to next available spot, grow array if necessary
get scan all pairs looking for given key, return associated item if found
containsKey scan all pairs, return if key is found
remove scan all pairs, replace pair to be removed with last pair in collection
size return count of items in dictionary
```

Big O Analysis

`put()`	O(n) linear
`get()`	O(n) linear
`containsKey()`	O(n) linear
`remove()`	O(n) linear
`size()`	O(1) constant

```
put('a', 1)
put('b', 2)
put('c', 3)
put('d', 4)
remove('b')
put('a', 97)
```



2 Minutes

Implementing a Dictionary with Nodes

Dictionary ADT

state

Set of items & keys
Count of items

behavior

put(key, item) add item to collection indexed with key
get(key) return item associated with key
containsKey(key) return if key already in use
remove(key) remove item and associated key
size() return count of items

LinkedDictionary<K, V>

state

front
size

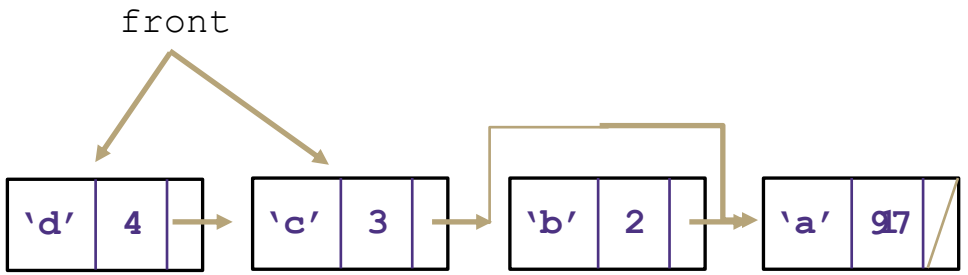
behavior

put if key is unused, create new with pair, add to front of list, else replace with new value
get scan all pairs looking for given key, return associated item if found
containsKey scan all pairs, return if key is found
remove scan all pairs, skip pair to be removed
size return count of items in dictionary

Big O Analysis

put()	O(n) linear
get()	O(n) linear
containsKey()	O(n) linear
remove()	O(n) linear
size()	O(1) constant

```
put('a', 1)
put('b', 2)
put('c', 3)
put('d', 4)
remove('b')
put('a', 97)
```



Traversing Data

Array

```
for (int i = 0; i < arr.length; i++) {
   System.out.println(arr[i]);
}
```

List

```
for (int i = 0; i < myList.size(); i++) {
   System.out.println(myList.get(i));
}
```

```
for (T item : list) {
   System.out.println(item);
}
```

Iterator!

Review: Iterators

iterator: a Java interface that dictates how a collection of data should be traversed. Can only move in the forward direction and in a single pass.

Iterator Interface
behavior hasNext() – true if elements remain next() – returns next element

supported operations:

hasNext() – returns true if the iteration has more elements yet to be examined

next() – returns the next element in the iteration and moves the iterator forward to next item

```
ArrayList<Integer> list = new ArrayList<Integer>();
//fill up list

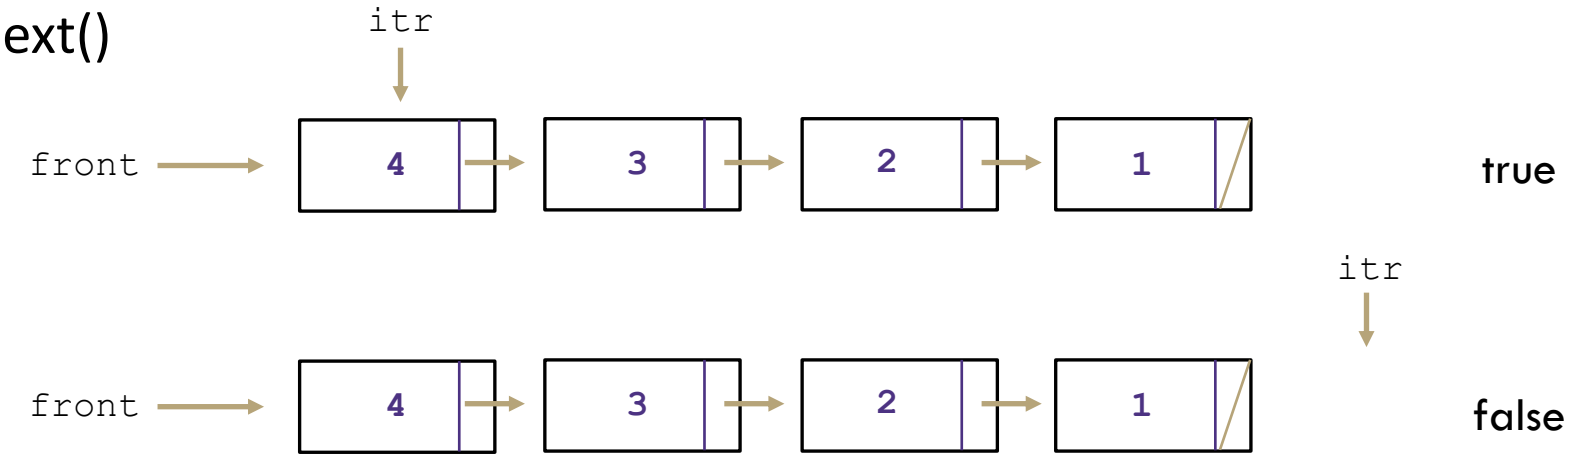
Iterator<Integer> itr = list.iterator();
while (itr.hasNext()) {
   int item = itr.next();
}
```

```
ArrayList<Integer> list = new ArrayList<Integer>();
//fill up list

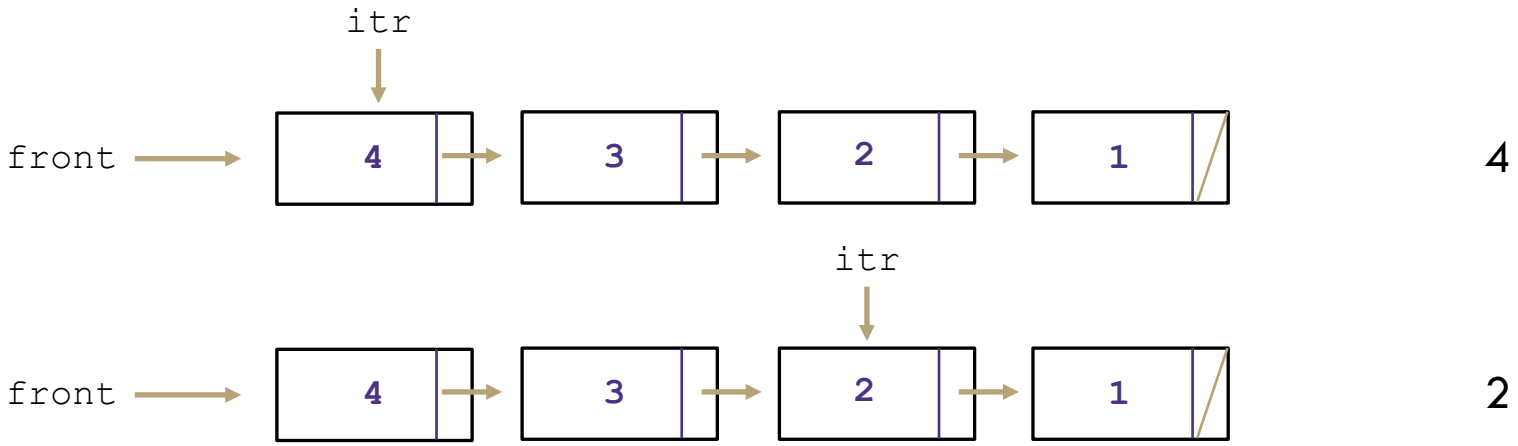
for (int i : list) {
   int item = i;
}
```

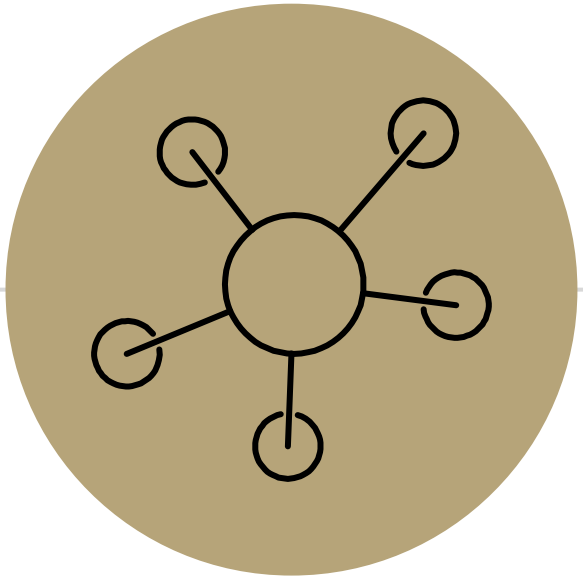
Implementing an Iterator

hasNext()



next()





Testing Your Code

Testing

Computers don't make mistakes- people do!

"I'm almost done, I just need to make sure it works"
– Naive 14Xers

Software Test: a separate piece of code that exercises the code you are assessing by providing input to your code and finishes with an assertion of what the result should be.

1. Isolate - break your code into small modules
2. Build in increments - Make a plan from simplest to most complex cases
3. Test as you go - As your code grows, so should your tests

Types of Tests

Black Box

- Behavior only – ADT requirements
- From an outside point of view
- Does your code uphold its contracts with its users?
- Performance/efficiency

White Box

- Includes an understanding of the implementation
- Written by the author as they develop their code
- Break apart requirements into smaller steps
- “unit tests” break implementation into single assertions

What to test?

Expected behavior

- The main use case scenario
- Does your code do what it should given friendly conditions?

Forbidden Input

- What are all the ways the user can mess up?

Empty/Null

- Protect yourself!
- How do things get started?
- 0, -1, null, empty collections

Boundary/Edge Cases

- First items
- Last item
- Full collections

Scale

- Is there a difference between 10, 100, 1000, 10000 items?

Testing Strategies

You can't test everything

- Break inputs into categories
- What are the most important pieces of code?

Test behavior in combination

- Call multiple methods one after the other
- Call the same method multiple times

Trust no one!

- How can the user mess up?

If you messed up, someone else might

- Test the complex logic

5 Minutes

Thought Experiment

Discuss with your neighbors: Imagine you are writing an implementation of the List interface that stores integers in an Array. What are some ways you can assess your program's correctness in the following cases:

Expected Behavior

- Create a new list
- Add some amount of items to it
- Remove a couple of them

Forbidden Input

- Add a negative number
- Add duplicates
- Add extra large numbers

Empty/Null

- Call remove on an empty list
- Add to a null list
- Call size on an null list

Boundary/Edge Cases

- Add 1 item to an empty list
- Set an item at the front of the list
- Set an item at the back of the list

Scale

- Add 1000 items to the list
- Remove 100 items in a row
- Set the value of the same item 50 times

JUnit

JUnit: a testing framework that works with IDEs to give you a special GUI experience when testing your code

```
@Test
public void myTest() {
    Map<String, Integer> basicMap = new LinkedListDict<String, Integer>();
    basicMap.put("Kasey", 42);
    assertEquals(42, basicMap.get("Kasey"));
}
```

Assertions:

- `assertEquals(item1, item2)`
- `assertTrue(Boolean expression)`
- `assertFalse(bollean expression)`
- `assertNotNull(item)`
