

Quickcheck 03: Analysis

Your friend used summations to make a model for the running time of one of their functions. Simplify their summations into a final (exact) closed form. Then determine what the big- \mathcal{O} of the function is.

$$\sum_{i=0}^{n-1} (6i^2 - 3) + \sum_{i=0}^{n-1} \frac{2^i}{n} + \sum_{i=0}^{n/2-1} \sum_{j=0}^{i-1} 1$$

Here is a list of identities that may be useful:

Manipulating Sums:

$$\sum_{i=a}^b (x + y) = \sum_{i=a}^b x + \sum_{i=a}^b y \quad \sum_{i=a}^b f(i) = \sum_{i=0}^b f(i) - \sum_{i=0}^{a-1} f(i) \quad \sum_{i=a}^b c \cdot f(i) = c \sum_{i=a}^b f(i)$$

Geometric Series Identities:

$$\sum_{i=0}^{n-1} x^i = \frac{x^n - 1}{x - 1} \quad \sum_{i=0}^{\infty} x^i = \frac{1}{1 - x} \text{ if } -1 < x < 1$$

Other Common Summations:

$$\sum_{i=0}^{n-1} i = \frac{n(n-1)}{2} \quad \sum_{i=0}^{n-1} i^2 = \frac{n(n-1)(2n-1)}{6} \quad \sum_{i=0}^{n-1} c = cn$$

Another question

Do you have any questions about this course? It could be about policy, content, instructors, TAs, etc.
