

CSE 373: Hash Tables

Chapter 5

Motivation

Goal: The ability to store and retrieve information in $O(1)$ time

Current Solutions:

Hash Table Goal

We can already do:

0	[]
1	[]
2	[3.2]
...	[]
a[2] = 3.2;	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]

We'd like to do:

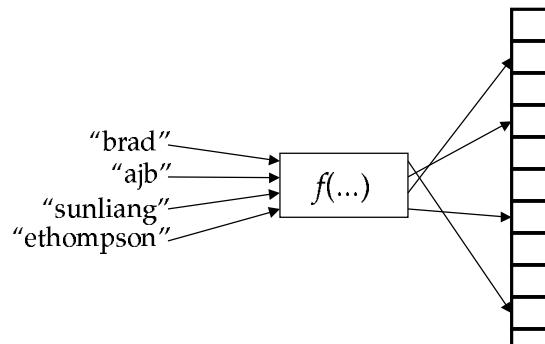

"brad"	[]
"ajb"	[]
"sunliang"	[3.9]
...	[]
a["sunliang"] = 3.9;	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]
	[]

Hashing Integers

What's a simple scheme for hashing integers?

```
int HashInteger(int key,int tablesize) {  
    return key % tablesize;  
}
```

- advantages?
- disadvantages?

UW, Autumn 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

General Strategies

- Selecting a good hash function often depends on the set of possible keys
- Using a hash table whose size is a prime number tends to help reduce conflicts

UW, Autumn 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Hashing Strings

General approach:

- convert string to integer
- “mod” integer by table size

Naive approach:

```
int HashString(char* key,int tablesize) {  
    int total=0;  
    while (*key) {  
        total += *key;  
    }  
    return total%tablesize;  
}
```

UW, Autumn 1999

Brad Chamberlain

Problem with Naive Approach

```
HashString("bat",n)
= HashString("tab",n);
= HashString("rad",n);
```

Total Number of Possibilities $\approx 127 \times 12 = 1524$
Useful Number of Possibilities $\approx 26 \times 12 = 312$

Probably not good if hash table size or number of keys is greater than this...

UW, Autumn 1999

Brad Chamberlain

Improved Approach

Read string as base 27 number:

$$\begin{array}{r} 1 \quad 27 \quad 729 \\ b \quad a \quad t = 2 \times 1 + 1 \times 27 + 20 \times 729 = 14,609 \\ t \quad a \quad b = 20 \times 1 + 1 \times 27 + 2 \times 729 = 1,505 \\ r \quad a \quad d = 18 \times 1 + 1 \times 27 + 4 \times 729 = 2,961 \end{array}$$

Advantages?

Disadvantages?

Brad Chamberlain

Other Ideas

Hash using only a subset of the characters...

- first three?
- last three?
- middle three?
- first, middle, last?
- etc.

Brad Chamberlain

Hash Function Design Goals

- Hash to all slots in your table
- Avoid collisions
- Hash as evenly as possible
- Hash as quickly as possible

(Again, note that much of this may depend on
the set of possible keys...)

UW, Autumn 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Harsh Hash Reality

- No matter how good your hash function is, collisions will probably occur
- Thus, we also need a collision resolution strategy...
 - separate chaining
 - resizable hash table
 - open addressing

Brad Chamberlain

Hash Table Operations

- Main Operations:

```
void insert(HashedObj& key);
HashedObj& find(HashedObj& key);
void remove(HashedObj& key);
```
- Normal Creation/Deletion Operations
- No iteration, **FindMin()**/**Max()**, etc.
(why?)

UW, Autumn 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Alternate Hash Table Operations

- Main Operations:

```
void insert(HashedObj& key, Object& data);  
Object& find(HashedObj& key);  
void remove(HashedObj& key);
```

- Similar to the normal interface, but associates some data with each key
