

CSE 373: Graphs

(Traversals, Shortest Paths)

Chapter 9

Depth-First Search (DFS)

A fundamental method for traversing a graph:

- start from a particular node...
- walk along a single path visiting nodes
- go back and try a different path only when stuck

DFS on Directed Graphs

Also applicable to directed graphs...

- Similar to pre-order traversals for trees
- Running time?
- edges walked by DFS form a *spanning tree*
- how would we implement this?

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

DFS Implementation

```
void DFS(vertex v) {
```

```
}
```

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Breadth-First Search (BFS)

Another way of traversing a graph

- start from a particular node...
- take one step along each of its edges
- then take one step per edge for each of those nodes

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

BFS on Directed Graphs

Also applicable to directed graphs...

- Running time?
- visited edges again form a *spanning tree*
- how would we implement this?

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

BFS Implementation

```
void BFS(vertex v) {  
  
  
  
  
  
  
  
  
  
  
  
  
}
```

Topological Sort

A notion of ordering the vertices in a DAG:

- If there is a path from u to v , u must appear before v in the ordering
- OR, a vertex v may not be printed out until all vertices with edges leading to it have been printed

Topological Sort on non-DAGs

Why don't topological sorts make sense on graphs that aren't DAGs?

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Topological Sort Applications

- Given a graph representing course prerequisites, topological sorts would indicate legal course schedules

- Given a callgraph for a non-recursive C program, topological sorts would indicate function orderings for the source file such that no prototypes are needed

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Using Searches for Topological Sort?

- Would a depth-first search visit nodes in topological order?
- Would a breadth-first search?
- What would?

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Naive Topological Sort

- Naive algorithm:
 - Keep track of each vertex's *in-degree*: the number of edges leading into it
 - Scan the vertex list looking for one whose in-degree is zero
 - Print that vertex out
 - Decrement the in-degrees of all adjacent vertices
- Running Time?
- How could this be improved?

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Improved Topological Sort

```
void TopSort(Graph G) {
```

```
}
```

Running Time?

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Shortest Path Problems

Given a graph $G = (V, E)$ and a vertex $s \in V$, find the shortest path from s to all other vertices

Many variations:

- unweighted graphs
- weighted graphs with no negative weights
- weighted graphs with negative weights
- weighted acyclic graphs

UW, Spring 1999

CSE 373 – Data Structures and Algorithms

Brad Chamberlain

Unweighted Shortest Path Problem

Assume source vertex is C...

distance to: **A B C D E F G H**

What approach could we use to implement this?

The Problem With Negative Weights

case 1:

case 2:
