# Computer Model

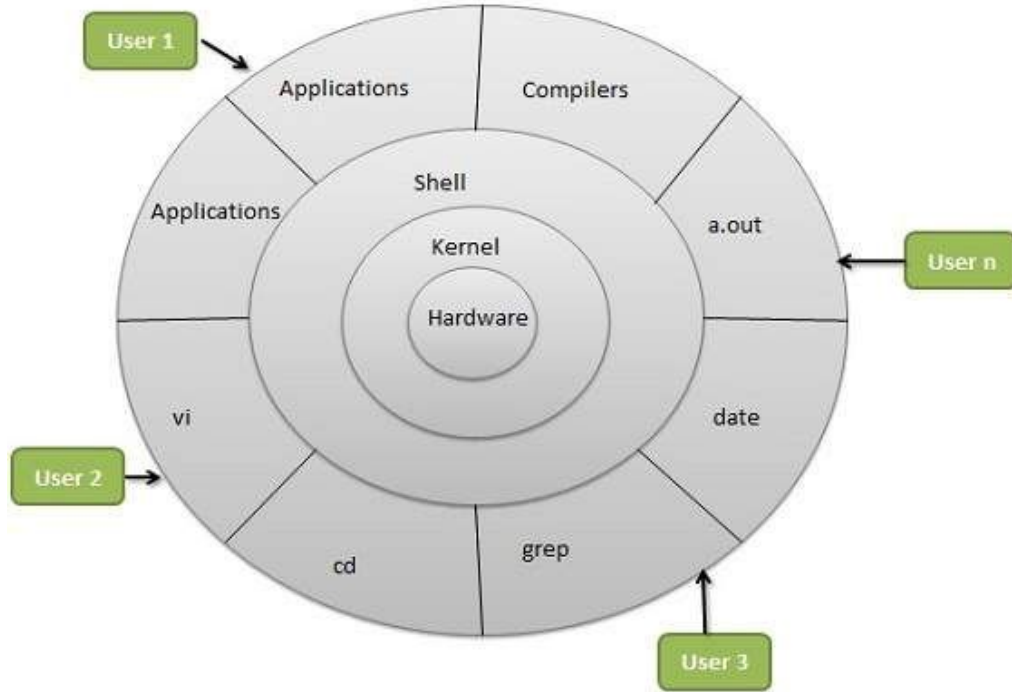

- ❖ One OS (CentOs) controls the computer.
- ❖ One filesystem stores data.
- ❖ Many processes are run. (A program runs one or many processes.)
- ❖ A shell is one process that allows for command line interface.
- ❖ Many users

# What is the OS?

- Memory Management
- Processor Management
- Device Management
- File Management
- Security
- Control over system performance
- Job accounting
- Error detecting aids
- Coordination between other software and users

# Linux Model

Linux -  
Portable; multi-user

Includes

- Hardware layer (drivers, etc.)
- Kernel (does all the hardware interaction)
- Shell (provides user friendly interface to kernel)
- Processors (various programs)
- Users - multiple users run processes

[http://www.tldp.org/LDP/intro-linux/html/chap\\_01.html](http://www.tldp.org/LDP/intro-linux/html/chap_01.html)

# Getting Started with Linux (CentOS)

**Use a virtual machine**

**Or**

**Log on to Klaatu**

<https://courses.cs.washington.edu/courses/cse374/21sp/resources/linux.html>

Log-in and get a ‘shell’

- Shell - text based interface
- Specifically ‘bash’

*Everyone should have a klaatu account - send email to cse374-staff if you can not access yours.*

# Linux & Shells

Text is efficient - typing is fast, and there aren't big image objects to pass around

Scripting makes it easy to automate text based interfaces

Linux *does* have a graphical interface

Windows and MacOS *do* have shell interfaces

Most power users use BOTH

You could use any distribution of Linux that is up-to-date. Using CentOS through CSE ensures consistency.

(What a distribution? Something like a 'flavor', or a branded implementations. Distributions vary somewhat.

# File Systems

- ❑ File systems are trees
- ❑ (or directed acyclic graphs)
- ❑ A file (or directory) is specified by its path from the top ('/')
- ❑ Can be specified absolutely (entire path),
- ❑ Relatively (from current location)
  - ❑ This directory './'
  - ❑ One directory up '../'
- ❑ You have access to your 'home' directory ('~')

Also true on Windows, btw, although the structure and some notation is different.

Demo - whoami, pwd, ls, mkdir, cd, cp, mv, rm less,more,text editors

[http://www.tldp.org/LDP/intro-linux/html/sect\\_03\\_01.html](http://www.tldp.org/LDP/intro-linux/html/sect_03_01.html)

# Processes & the Shell

Shell essentially runs programs, or processes. Shell *is* a process, and has a state.

Usually launch a process, and return to shell when done.

Each process has own memory stream and I/O

Stdin (keyboard), stdout (console), stderr

Many processes have options

*"On a UNIX system, everything is a file; if something is not a file, it is a process."*

'&' runs process in the background

'fg', 'bg', top, kill

Control where processes run

Step through a script with built-in 'source'

Can redirect input and output ('<', '>')

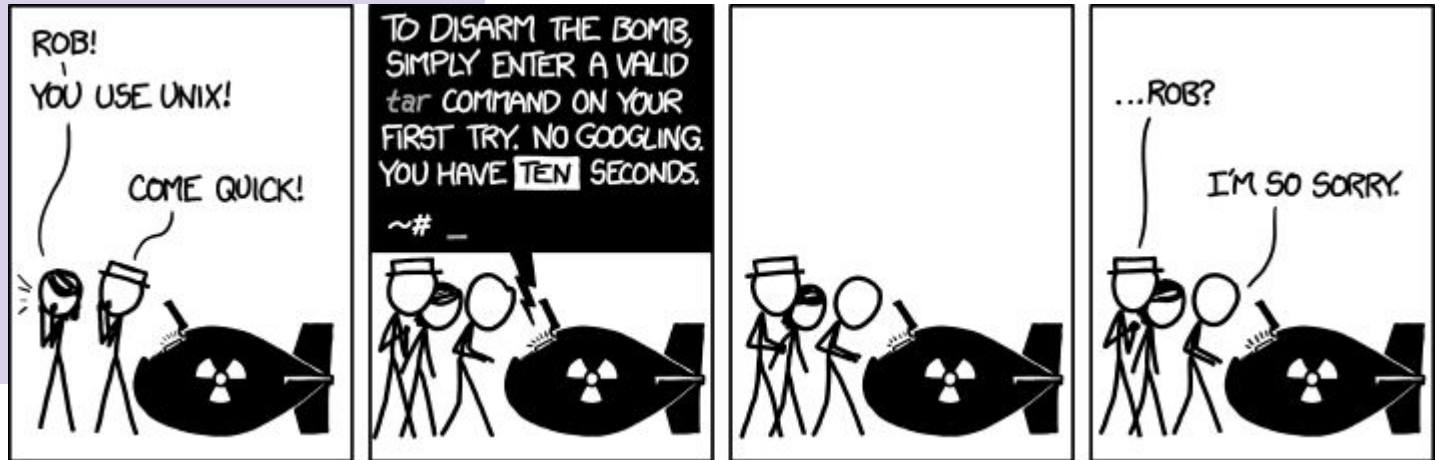

# Getting Help

Most commands: 'man ls'

Also "--help"

Look for keyword: 'man -k'

[http://www.tldp.org/LDP/intro-linux/html/sect\\_02\\_03.html](http://www.tldp.org/LDP/intro-linux/html/sect_02_03.html)

# Bash Language

- Bash acts as a language interpreter
  - Commands are subroutines with arguments
  - Bash interprets the arguments & calls subroutine
  - Bash also has its own variables and logic

*BASH applies its own processing  
to the I/O text - 'globbing'*

# Shell Behavior

All redirection & string expansion or substitutions are done by the shell, before the command.

Command only sees resulting I/O streams.

# Special Characters

- Directory Shortcuts
  - ~uname or ~
  - ./ or ../
- Wildcards - *Globbering*
  - 0 or more chars: \*
  - Exactly 1 char: ?
  - Specified chars: [a-f]

History, or '!'

# Special Characters

! > < & | \* ~ [] “ ‘ ` \$ /

\ is escape  
character

“string”

‘string’

What do they all  
mean?

Would substitute  
things like \$VAR

Suppresses  
substitutions
