

Examples of what to store in pipeline registers

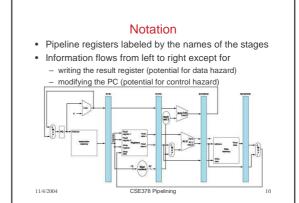

- The following is not an exhaustive list (just a sample)
- The register number where the result will be stored – Known at stage 2; needed at stage 5
- The register number of the data containing the contents of a "store" as well as the contents of that register
 Known at stage 2; needed at stage 4
- The immediate value
- Known at stage 2; needed at stage 3
- The updated PC (we'll see why later)
- etc ..

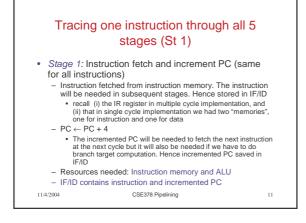

6

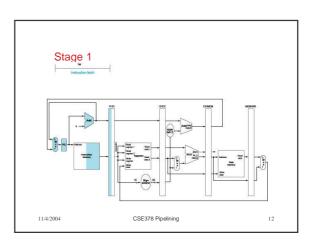

- Stage 2: Instruction decode and register read (same for all instructions)
 - We save in ID/EX everything that can be needed in next stages:
 The instruction and the incremented PC (from IF(ID) (e.g., function)
 - The instruction and the incremented PC (from IF/ID) (e.g., function bits can be needed, the name of the register to be written etc.)
 - The contents of registers rs and rt (recall registers A and B)
 The sign extended immediate field (for imm. Inst., load/store, branch)
 - The sign extended immediate field (for imm. Inst., load/store, brail
 Control lines et-ups. We'll deal with control later
 - Note that we do not compute the branch target address here (why?).
 Resources needed: register file, control unit

13

ID/EX contains PC, instruction, contents of rs and rt, extended imm. Field, control lines set-ups
