## Week 7 Workshop

## 0. Structural Induction: Divisible by 4

Define a set $\mathfrak{B}$ of numbers by:

- 4 and 12 are in $\mathfrak{B}$
- If $x \in \mathfrak{B}$ and $y \in \mathfrak{B}$, then $x+y \in \mathfrak{B}$ and $x-y \in \mathfrak{B}$

Prove by induction that every number in $\mathfrak{B}$ is divisible by 4 .

## Complete the proof below:

Let $\mathrm{P}(n)$ be defined as $\qquad$ . We will prove $P(n)$ is true for all $\qquad$ by structural induction.

## Base Cases:

So the base cases holds.
Inductive Hypothesis: Suppose $\qquad$ .

## Inductive Step:

Goal: Show

Conclusion: So by induction, $\mathrm{P}(n)$ is true for all $\qquad$ -

## 1. Structural Induction: a's and b's

Define a set $\mathcal{S}$ of character strings over the alphabet $\{a, b\}$ by:

- $a$ and $a b$ are in $\mathcal{S}$
- If $x \in \mathcal{S}$ and $y \in \mathcal{S}$, then $a x b \in \mathcal{S}$ and $x y \in \mathcal{S}$

Prove by induction that every string in $\mathcal{S}$ has at least as many $a$ 's as it does $b$ 's.

## 2. Structural Induction: CharTrees

## Recursive Definition of CharTrees:

- Basis Step: Null is a CharTree
- Recursive Step: If $L, R$ are CharTrees and $c \in \Sigma$, then $\operatorname{CharTree}(L, c, R)$ is also a CharTree

Intuitively, a CharTree is a tree where the non-null nodes store a char data element.

## Recursive functions on CharTrees:

- The preorder function returns the preorder traversal of all elements in a CharTree.

$$
\begin{array}{ll}
\operatorname{preorder}(\operatorname{Null}) & =\varepsilon \\
\operatorname{preorder}(\operatorname{CharTree}(L, c, R)) & =c \cdot \operatorname{preorder}(L) \cdot \operatorname{preorder}(R)
\end{array}
$$

- The postorder function returns the postorder traversal of all elements in a CharTree.

```
postorder(Null) =\varepsilon
postorder(CharTree (L,c,R)) = postorder (L) \cdot postorder (R) \cdotc
```

- The mirror function produces the mirror image of a CharTree.

$$
\begin{array}{ll}
\operatorname{mirror}(\operatorname{Null}) & =\operatorname{Null} \\
\operatorname{mirror}(\operatorname{CharTree}(L, c, R)) & =\operatorname{CharTree}(\operatorname{mirror}(R), c, \operatorname{mirror}(L))
\end{array}
$$

- Finally, for all strings $x$, let the "reversal" of $x$ (in symbols $x^{R}$ ) produce the string in reverse order.

## Additional Facts:

You may use the following facts:

- For any strings $x_{1}, \ldots, x_{k}:\left(x_{1} \cdot \ldots \cdot x_{k}\right)^{R}=x_{k}^{R} \cdot \ldots \cdot x_{1}^{R}$
- For any character $c, c^{R}=c$

## Statement to Prove:

Show that for every CharTree $T$, the reversal of the preorder traversal of $T$ is the same as the postorder traversal of the mirror of $T$. In notation, you should prove that for every CharTree, $T$ : $[\operatorname{preorder}(T)]^{R}=$ postorder(mirror $(T))$.

There is an example and space to work on the next page.

## Example for Intuition:

Let $T_{i}$ be the tree above.
( $T_{i}$ ) ="abcd".
$T_{i}$ is built as (null, $a, U$ )
Where $U$ is $(V, b, W)$,
$V=($ null,$c$, null $), W=(n u l l, d$, null $)$.

This tree is $\left(T_{i}\right)$.
$\left(\left(T_{i}\right)\right)=$ "dcba",
"dcba" is the reversal of "abcd" so
$\left[\operatorname{preorder}\left(T_{i}\right)\right]^{R}=\operatorname{postorder}\left(\operatorname{mirror}\left(T_{i}\right)\right)$ holds for $T_{i}$
