# CSE 391 Lecture 3

bash shell continued: processes; multi-user systems; remote login; editors

## Lecture summary

- A bit more on combining commands
- Processes and basic process management
- Connecting to remote servers (attu)
  - multi-user environments
- Text editors

## Review: Redirection and Pipes

- command > filename
  - Write the output of command to filename (>> to append instead)
- command < filename</li>
  - Use filename as the input stream to command
- command1 | command2
  - Use the console output of command1 as the input to command2
- command1; command2
  - Run command1 and then run command2
- command1 && command2
  - Run command1, if completed without errors then run command2

# **Tricky Examples**

- The wc command can take multiple files: wc names.txt student.txt
  - Can we use the following to wc on every txt file in the directory?

```
•ls *.txt | wc
```

- Amongst the top 250 movies in movies.txt, display the third to last movie that contains "The" in the title when movie titles are sorted.
- Find the disk space usage of the man program
  - Hints: use which and du...
  - Does which man | du work?

Answers posted in lecture\_commands.txt after lecture

## The back-tick

### command1 `command2`

- run command2 and pass its console output to command1 as a parameter; is a back-tick, on the ~ key; not an apostrophe
- best used when command2's output is short (one line)

- Finish the example!
  - du `which man`

### xargs

command	description
xargs	run each line of input as an argument to
	a specified command

- xargs allows you to repeatedly run a command over a set of lines
  - often used in conjunction with find to process each of a set of files
- Example: Remove all my .class files.

```
find ~ -name "*.class" | xargs rm
```

- Find the disk usage of man using xargs
  - which man | xargs du

### **Processes**

- process: a program that is running (essentially)
  - when you run commands in a shell, it launches a process for each command
  - Process management is one of the major purposes of an OS

PID: 1232
Name: Is

PID: 1173
Name: gedit

PID: 1343
Name: man

PID: 1723
Name: Mozilla

PID: 1288
Name: cp

## **Process commands**

command	description
ps or jobs	list processes being run by a user; each process has a unique integer id (PID)
top	show which processes are using CPU/memory; also shows stats about the computer
kill	terminate a process by PID (sometimes –KILL is needed)
killall	terminate several processes by name

- use kill or killall to stop a runaway process (infinite loop)
  - similar to ^C hotkey, but doesn't require keyboard intervention

# **Background processes**

command	description
&	(special character) when placed at the end of a command, runs that command in the background
^Z	(hotkey) suspends the currently running process
fg, bg	resumes the currently suspended process in either the foreground or background

- If you run a graphical program like gedit from the shell, the shell will lock up waiting for the graphical program to finish
  - instead, run the program in the background, so the shell won't wait:\$ gedit homework1.txt &
  - if you forget to use & , suspend gedit with ^Z , then run bg
  - lets play around with an infinite process...

# Connecting with ssh

command	description
ssh	open a shell on a remote server

- Linux/Unix are built to be used in multi-user environments where several users are logged in to the same machine at the same time
  - users can be logged in either locally or via the network
- You can connect to other Linux/Unix servers with ssh
  - once connected, you can run commands on the remote server
  - other users might also be connected; you can interact with them
  - can connect even from other operating systems

## The attu server

• attu: The UW CSE department's shared Linux server

connect to attu by typing:

ssh attu.cs.washington.edu

(or ssh username@attu.cs.washington.edu if your Linux system's user name is different than your CSE user name)

• Note: There are several computers that respond as attu (to spread load), so if you want to be on the same machine as your friend, you may need to connect to attu2, attu3, etc.

## Multi-user environments

command	description
whoami	outputs your username
passwd	changes your password
hostname	outputs this computer's name/address
w or finger	see info about people logged in to this server
write	send a message to another logged in user

• Exercise: Connect to attu, and send somebody else a message.

## **Network commands**

command	description
links or lynx	text-only web browsers (really!)
ssh	connect to a remote server
sftp or scp	transfer files to/from a remote server
	(after starting sftp, use get and put commands)
wget	download from a URL to a file
curl	download from a URL and output to console
alpine, mail	text-only email programs

## **Text editors**

command	description
pico or nano	simple editors
emacs	More advanced text editor
vi or vim	More advanced text editor

- you cannot run graphical programs when connected to attu (yet)
  - so if you want to edit documents, you need to use a text-only editor
- most advanced Unix/Linux users learn emacs or vi
  - I would recommend you try to pick up the basics of one of these.
  - Your choice!

## **Aliases**

command	description
alias	assigns a pseudonym to a command

#### alias *name=command*

- must wrap the command in quotes if it contains spaces
- Do not put spaces on either side of the =
- Example: When I type q , I want it to log me out of my shell.
- Example: When I type 11, I want it to list all files in long format.

```
alias q=exit
alias ll="ls -la"
```

- Exercise: Make it so that typing q quits out of a shell.
- Exercise: Make it so that typing woman runs man.
- Exercise: Make it so that typing attu connects me to attu.

# Mounting remote files

command	description
sshfs	mount and interact with remote directories and files

- An alternate usage model to remotely connecting to servers is mounting remote directories and files and work on them locally
  - once mounted, use remote directories and files as if they were local

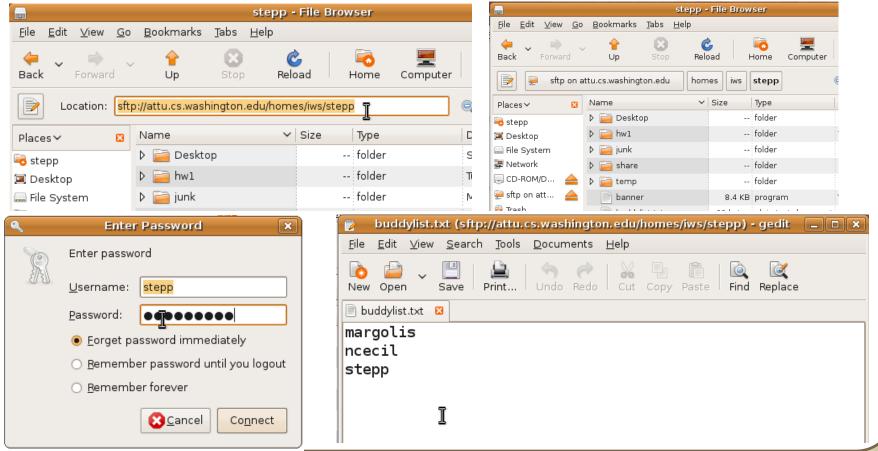

# Mounting cse homedir on VM

https://www.cs.washington.edu/lab/software/homeVMs/linuxVM#install

- Create a directory in your home directory, called csehomedir:
  - cd
  - mkdir csehomedir
- Now to use that directory as a "link" to your CSE files on your VM:
  - sshfs username@attu: ~/csehomedir OF
  - sshfs username@attu.cs.washington.edu:/homes/iws/username ~/csehomedir/
- It is a good idea to back up your files from your VM regularly.
  - Actually keep your files on your CSE home directory
  - Regularly move files from your VM to another location
  - If you need to get a fresh VM image, you can save the files from your old VM using this procedure: "My VM Seems Broken. How Do I Recover?"
- https://www.cs.washington.edu/lab/software/homeVMs/linuxVM#faq

# Remote editing

- Gnome's file browser and gedit text editor are capable of opening files on a remote server and editing them from your computer
  - press Ctrl-L to type in a network location to open

# My VM is Broken!

#### https://www.cs.washington.edu/lab/software/homeVMs/linuxVM#install

- If your VM is misbehaving, first try a reboot of the VM and also of your machine. If that doesn't work, often it is easiest just to get a fresh VM image and start over (maybe you saved the .zip file you downloaded previously?)
- BEFORE you delete your current copy of the VM, you can save the files from your current copy of the VM using this procedure:
  - See "My VM Seems Broken. How Do I Recover?" here:

https://www.cs.washington.edu/lab/software/homeVMs/linuxVM#faq
