Use version control, even for solo projects

Interesting idea:
- Removing all redundant code, in itself, leads to good design
- Informal work atmosphere
  - Pointy hats, traffic lights, smiley faces
  - Mileage may vary

Incremental build
- Master copy always up to date and working
- Continuous development

Very quick release cycle
- Implications for development and test process
- Rapid requirements change?
- Where was test?

Lead codes quickly, junior programmers fix bugs
- Recognized as a stupid approach
- Feedback cycle the wrong direction
  - The worse your code, the more you write
- Devs aim for high quality through testing their own code
  - Major testing phase after integration
- Continuous bug fixing
  - Clear all Pri 1 bugs as detected
  - Depends upon early integration
