# Rules about breaking the build

Rule 1: Never ever break the build

Rule 2: If you do break the build, fix it immediately and beg for forgiveness

Rule 3: Don't change other people's files without their permission

Rule 4: The closer one gets to the finish line the more important rule one becomes

Rule 5: Don't make superfluous last minute changes

Rule 6: Whenever in doubt, see rule 1

---

# Consequences of breaking the build

- Increases development cost
- Adds risk to the project
- Undermines group synergy

- Personally you may

- » Have your name published widely within the company
- » Receive 2:00 AM phone calls
- » Wear the goat horns
- » Pay \$ into the build lab's refreshment / antacid fund

## Some ways to avoid breaking the build

- Do a clean build and run all the tests
- Buddy builds
- Have your changes reviewed
- Develop using separate development trees
- Do what's right by you and your teammates

5

## Why is it so important not to break?

- Lots of other people are making decisions and schedule commitments
  - » The software is growing up and moving away from the development team
- Many of the dates were almost random when initially picked
  - » But changing them now is very expensive, very inconvenient, and very embarrassing

### Code-Freeze Status

### FreeBSD CVS Branches

The following table lists the code freeze status for the major branches of the `src/` subtree of the FreeBSD CVS repository. Commits to any branch listed as "frozen" must first be reviewed and approved by the relevant contact party. The status of other subtrees such as `ports/` and `doc/` is also provided below.

Branch	Status	Contact	Notes
HEAD	Open		Active development branch for -CURRENT.
RELENG_5	Open	<a href="mailto:re@FreeBSD.org">re@FreeBSD.org</a>	Development branch for 5-STABLE.
RELENG_5_3	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 5.3 supported security fix branch.
RELENG_5_2	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 5.2 / 5.2.1 security fix branch (not officially supported).
RELENG_5_1	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 5.1 security fix branch (not officially supported).
RELENG_5_0	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 5.0 security fix branch (not officially supported).
RELENG_4	Open	<a href="mailto:re@FreeBSD.org">re@FreeBSD.org</a>	Development branch for 4-STABLE.
RELENG_4_11	Frozen	<a href="mailto:re@FreeBSD.org">re@FreeBSD.org</a>	Release branch for upcoming FreeBSD 4.11.
RELENG_4_10	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 4.10 supported errata fix branch.
RELENG_4_9	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 4.9 security fix branch (not officially supported).
RELENG_4_8	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 4.8 supported security fix branch.
RELENG_4_7	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 4.7 security fix branch (not officially supported).
RELENG_4_6	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 4.6 security fix branch (not officially supported).
RELENG_4_5	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 4.5 security fix branch (not officially supported).
RELENG_4_4	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 4.4 security fix branch (not officially supported).
RELENG_4_3	Frozen	<a href="mailto:security-officer@FreeBSD.org">security-officer@FreeBSD.org</a>	FreeBSD 4.3 security fix branch (not officially supported).

Done

### Schedule

### FreeBSD 5.4 Release Process

Action	Expected	Actual	Description
Reminder announcement	31 Jan 2005	31 Jan 2005	Release Engineers send announcement email to developers with a rough schedule for the FreeBSD 5.4 release.
Announce the Ports Freeze	--	--	Someone from <code>portmgr@</code> should email <code>freebsd-ports@</code> to set a date for the week long ports freeze and tagging of the ports tree.
5.4-PRERELEASE	23 Feb 2005	--	<code>newvers.sh</code> updated.
Code freeze begins	2 Mar 2005	--	After this date, all commits to the RELENG_5 branch must be approved by <a href="mailto:re@FreeBSD.org">re@FreeBSD.org</a> . Certain highly active documentation committers are exempt from this rule for routine man page / release note updates. Heads-up emails should be sent to the developers, as well as <code>stable@</code> and <code>qa@</code> lists.
5.4-PRERELEASE	4 Mar 2005	--	First public test release build.
RELENG_5_4 branch	16 Mar 2005	--	The release branch is created. Update <code>newvers.sh</code> and <code>release.ent</code> on various branches involved.
Unfreeze the tree	16 Mar 2005	--	Announcement to developers explaining that commits to RELENG_5 no longer require approval. Also note the policy for commits to the RELENG_5_4 branch.
5.4-RC1	16 Mar 2005	--	<code>newvers.sh</code> and <code>release.ent</code> updated.
First release candidate	18 Mar 2005	--	The first release candidate for the each architecture is released. ISO images should be uploaded to <code>ftp-master.FreeBSD.org</code> . A network install directory should be uploaded to <code>ftp-master.FreeBSD.org</code> . The <code>packages/</code> directory should be a <i>relative</i> symlink, as described in the releng article. When the builds begin send a note to <a href="mailto:mirror-announce@FreeBSD.org">mirror-announce@FreeBSD.org</a> saying a "Normal Release Cycle" is beginning. RC ISOs and install directories will be coming through the next few weeks.

## Is it ready to ship?

---

- Who decides when it is ready to ship?
  - » The developer?
  - » The customer?
  - » The managers?
  - » The executive?
- What factors are involved in the decision?
  - » Is the software ready?
  - » Do we need the revenue?
  - » Is there an external factor that is setting the completion date?

## It's not just the software ...

---

- Development and testing plays a big role in getting the product ready, but there is also...
- Documentation
- Manufacturing
- Sales and marketing
- Support and more

## Does it meet the requirements?

---

- Is the quality sufficient for the customer
  - » PC mentality
  - » Mission critical systems
  - » Financial, medical, imbedded systems in planes, factories, safety critical equipment

## Is the software ready and tested?

---

- What are the remaining bugs like?
  - » Are there showstopper bugs (i.e., bugs that you cannot ship knowing they are in the product)
  - » What is the cost of keeping a known bug in the product
    - Is it an obscure bug
    - Are there easy workarounds for the bug
    - Is the product “bug free”

## Is the software ready and tested?

---

- In house testing
  - » Is the daily pass rate acceptable? The definition of acceptable open to discussion.
  - » Has it successfully run through its validation suite?
  - » Is everyone happy with the product?
- Off-site testing through release candidates
  - » Are the beta customers satisfied?
- Is the product stable enough for its intended market?
- What do we do when we stop finding bugs?

## Documentation done and accurate?

---

- Is manufacturing ready for the release?
  - » There is physical manufacturing and shipping of the release media and documentation
  - » Filling the distribution channel
  - » Even with internet distribution there needs to be well planned capacity
- Is product support ready?
  - » Whether the support is “on-site”, “9 to 5”, “24 / 7”, “phone”, or “mail only”, the support staff needs to be trained and have adequate communication capacity.
- Is sales and marketing ready?

## Customer ready?

---

- A lot of this depends on the type of customer
  - » The shrink warp market
  - » ISV – More technically savvy than the regular shrink wrapped market, however also less tolerant of stupid errors
  - » IHV – They have a different set of issues from ISV including automated setup and installation, and customization support
  - » Contract work – Various levels from delivering an entire turnkey system to only a small component that the buyer will integrate.
  - » Internal customer group

## Ship mode

---

- In the Windows NT group, this was called “showstopper mode” or the “death march” a rather macabre term, but also rather accurate
- All source changes must be reviewed and approved. It must be for a specific showstopper bug. Bugs are recorded in a bug database called “raid”. Sometimes kept an open showstopper bug active just to check-in more “fixes”
- Daily builds and stress runs (yes, seven days a week including most holidays)

## A typical day near the end

---

- 5 AM results are starting to be gathered for the previous night stress run
- 7 AM release of the previous nights stress results.  
Developers then have until noon or so to debug all the crashed machines. Sometimes you need to keep the machine a lot longer.
- 8 AM meeting of the development team managers looking at the nightly stress results and new bugs review (they decide which bugs need to be fixed, and when to ship the product). Near the very end this becomes a twice a day meeting
- 10 AM to 3 PM the build lab is willing to accept any bug fixes for approved showstopper bugs
- 5 PM dinner is served
- 6 PM the next build is released and everyone installs the new system and starts up stress, and those with showstopper bugs continue to work.

## Finally

---

- When it is finally decided to ship the product then the bits go into escrow as the golden media is produced and manufacturing starts ramping up. Testing continues and if necessary the bits can be recalled from escrow and the release done over again.
- Work continues on the subsequent release for the various server editions and international language versions.

## Ancillary issues

---

- Media hype
  - » Setting expectations
  - » Beta previews
  - » Getting beta customer testimonials might be important
- Competitive pressure
  - » Market share before quality
  - » First one defines the market and grabs market share even with junk
  - » The followers often play catch-up with mixed success (unless you are a monopoly)

## More issues

---

- Timing the release
- When do we get paid and are we ready for the IPO?
- Major release vs. minor release
  - » Big delta or small delta
  - » Customer perception based on version number
    - Word 1.0 for Windows
    - Word 1.1 for Windows
    - Word 2.0 for Windows
    - Word 6.0 for Windows
    - Word 95/97
    - Word 2002
  - » Some IHV contracts are based on version number
- Where to have the ship party
