

Lecture 25: Lessons from the History of Software Development (Part III)

18 Aug 2006

CSE403, Summer'06, Lecture 25b

Valentin Razmov

Outline

- n Is Software Different?
- n Trends from the History of Software Development
 - n Sophistication of skills (of developers and users)
 - n Propagation of good development practices
 - n Size of projects and products
 - n Criticality of getting it right

18 Aug 2006

CSE403, Summer'06, Lecture 25b

Valentin Razmov

Putting the Numbers in Perspective

Student
Submission

How large is the largest software product you have ever worked on?

- a) 10^3 LOC
- b) 10^4 LOC
- c) 10^5 LOC
- d) More

What is the software industry's average productivity (in LOC) per person per year?

- a) 10^3 LOC
- b) 10^4 LOC
- c) 10^5 LOC
- d) More

Valentin Razmov

Getting It Right: Is Software Born Correct?

Student
Submission

- n Should software be assumed to be faulty until the use of the best known methods can demonstrate that it is correct? Or should it be vice versa?

n Which way do you lean?

- a) Faulty until proven correct
- b) Correct until proven faulty

§ Why?

Lessons from "Ariane 5"

(http://www2.vuw.ac.nz/staff/stephen_marshall/SE/Failures/SE_Ariane.html)

- (A) **Test!**
- (B) **Try to write code that cannot fail.**
 - The SRI should never have sent data to the main computer that was not valid and open to be misinterpreted as flight instructions.
- (C) **Don't allow errors or exceptions to propagate in an uncontrolled manner.**
 - The possibility of an exception had been allowed for in the design, just not for this particular calculation.
- (D) **When reusing code from another system, make sure any existing requirements / assumptions remain valid.**
 - You should be able to track from requirements to code and vice-versa.
- (E) **Reused code still needs to be tested.**
 - Yes, its likely to have fewer bugs if it has worked before, but the reuse has changed the context, new bugs may appear or old ones be exposed.
- (F) **Make sure that the documentation links aspects of the design with specific requirements and vice versa.**
 - ... so that when requirements are changed, affected design and coding decisions can be easily identified.
- (G) **Test!**

Driving Forces behind the Evolution of Software Dev't

- Software becomes a business and a profession
 - No longer just a hobby
 - Building more and more complex projects
 - Standards emerge
- Best practices get distilled over time
 - Lifecycle processes
 - Designing for change, for test, for leanness, etc.
- Productivity tools appear that aid developers
- Economic and societal trends play an increasingly important role
 - Society increasingly depends on the technology and its robustness and safety

Lecture 26: Course Retrospective

18 Aug 2006

CSE403, Summer'06, Lecture 26

Valentin Razmov

Outline

- How this course differs from others
- What this course did not offer
- My version of the main take-away points

18 Aug 2006

CSE403, Summer'06, Lecture 26

Valentin Razmov

How Software Engineering Differs from Other Courses

Student
Submission

- How is Software Engineering different from other courses and disciplines you have been exposed to?
 - (List the *most important* difference in your mind.)

18 Aug 2006

CSE403, Summer'06, Lecture 26

Valentin Razmov

How Software Engineers Differs ... – My View

- Holistic nature of the discipline
- Making high-level decisions – beyond the technical ones – but at least as important
- Few clear-cut answers; mostly good practices
- Larger teams
- Opportunity to propose and work on your own ideas
- Instructors in the coaching role
- Mistakes along the way are encouraged, not penalized
- Plans (always) change
- Content topics: software design, testing, project management, etc.

18 Aug 2006

CSE403, Summer'06, Lecture 26

Valentin Razmov

What Software Engineering Encompasses (revisited)

- n In contrast to many CS disciplines you have been exposed to, software engineering includes elements of:
 - n **Computer science** (incl. algorithms, data structures, programming languages, tools)
 - n **Business and management** (incl. project management, scheduling, prioritization)
 - n **Economics/marketing** (incl. what makes a product sell, niche markets, monopolies)
 - n **Communication** (incl. managing relations with stakeholders – customers, management, developers, testers, sales)
 - n **Law** (incl. patents, licenses, copyrights, reverse engineering)
 - n **Sociology** (incl. modern trends in societies, localization, ethics)
 - n **Political science** (incl. topics at the intersection of law, economics, and global societal trends; (public) safety)
 - n **Psychology** (incl. personalities, styles, usability, what makes things fun)
 - n **Art** (incl. GUI design, what makes things appealing)
 - n ... more
- n Hence, the flavor of the discipline is necessarily “softer” and there are fewer clearly right/wrong answers.

18 Aug 2006

CSE403, Summer'06, Lecture 26

Valentin Razmov

What I Think You Have Gotten out of This Course

- n Get exposure to some of the best software development practices in use today
- n Learn how to more effectively collaborate with others toward a common goal
- n Understand how software is produced – from conception to shipping and subsequent maintenance
- n Have experience working in a larger team toward a common goal
- n Be able to lead an intelligent conversation with expert practitioners in the field of software engineering
- n Understand the issues and tradeoffs involved in making decisions as software engineers and project managers

18 Aug 2006

CSE403, Summer'06, Lecture 26

Valentin Razmov

How This Course Differs from the “Real World” of Software

- n Aspects of “real world” software development that this course has *not* exposed you to
 - n Changing requirements
 - n Real outside customers
 - n Working full-time on a major software project
 - n Working on an existing project with its constraints (i.e., not starting from scratch)
 - n People leaving and joining the team partway into a project
 - n Monetary compensation

18 Aug 2006

CSE403, Summer'06, Lecture 26

Valentin Razmov

The Main Take-Away Points in a Nutshell – My View

- n It is all about *risk management*.
 - n Requirements gathering, designing, prototyping, incremental releases, testing, code reviewing, refactoring, scheduling, prioritizing, etc.
- n The notion that you provide *value* to your customers
- n In all interactions, ask yourself who your audience is and what their expectations are.
- n Good management and communication are crucial to success.
 - n It sounds easy until one experiences it first-hand.
 - n Software development is an inherently human activity.
- n Frequent incremental releases are invaluable.

18 Aug 2006

CSE403, Summer'06, Lecture 26

Valentin Razmov

Peer Appreciation Activity

- n **When:** After a big milestone/product delivery
- n **Why:** To clear out any residual stress and (maybe) hard feelings, and to (re)unite the team
- n **How:**
 - n All teammates sit in a circle. One person speaks at a time.
 - n Someone starts, turning to the person to their right, and addressing them with *exactly* the phrase below.
 - n Name and blank must be substituted appropriately. ☺
 - n The recipient repeats this with the person to their right, while everyone listens.
 - n Turn around the circle several times for best results.
 - n After each turn, switch places or direction of movement.
- n **Example:** “*Joe*, I appreciate you for _____.”
