

CSE 403

Software engineering in the small (Startups)

CSE 403: Software Engineering

- Basic introduction to software engineering
- Typical for small engineering teams (5-10 people), in small companies (and big companies)
- Is there an alternative? Say, when starting a company?

Where we are at...

- You have a good foundation of fundamentals
- You have current up to date skills
- You are working well as a team

Can you start a company?

Mostly thinking about
consumer products...

The Lean Startup

The Lean Startup: a scientific approach to creating and managing startups and get a desired product to customers' hands faster.

Details

Minimal Team

- Hacker (Person writing most of the code)
- Hustler (Business side of things, product management)
- Hipster (Designer)
- Could add 2-3 more hackers

From idea to prototype

- What's the high level vision?
- Customer analysis
- Market sizing
- Assess your skills
- Figure out your tools and platform

Hack out a prototype

- 10 weeks?
- 2 weeks?
- Weekend?

Hackathon

A **hackathon** (also known as a **hack day**, **hackfest** or **codefest**) is an event in which [computer programmers](#) and others in the field of [software development](#), like [graphic designers](#), [interface designers](#), [project managers](#) and [computational philologists](#)^[1], collaborate intensively on [software](#) projects.^[2]

Hackathons

Iterate on the prototype

- Starting point for testing and fast iterations
- Apply pirate principles to get customers
- See what traction you get
- Ignore much of the software process that we've talked about -- back fill later
- Form a company, get some money, hire some people
- Search for product/market fit

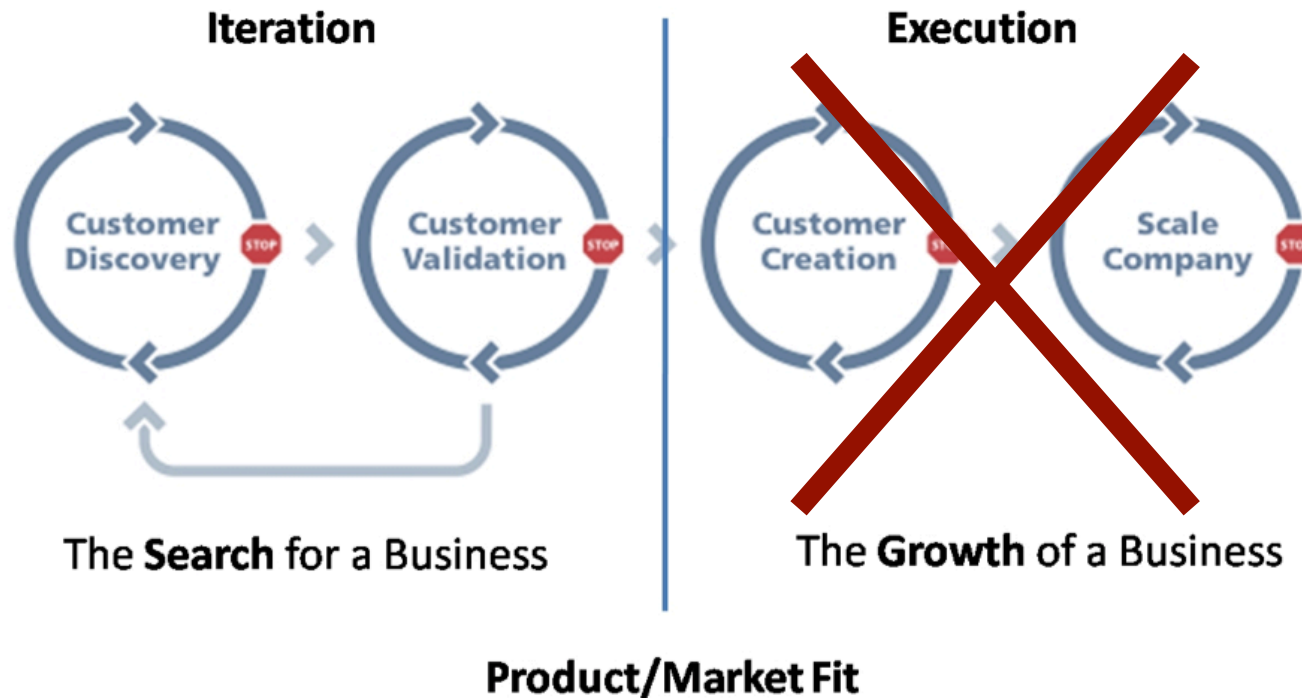

Goal: Product-Market fit (Discover customers)

Iteration

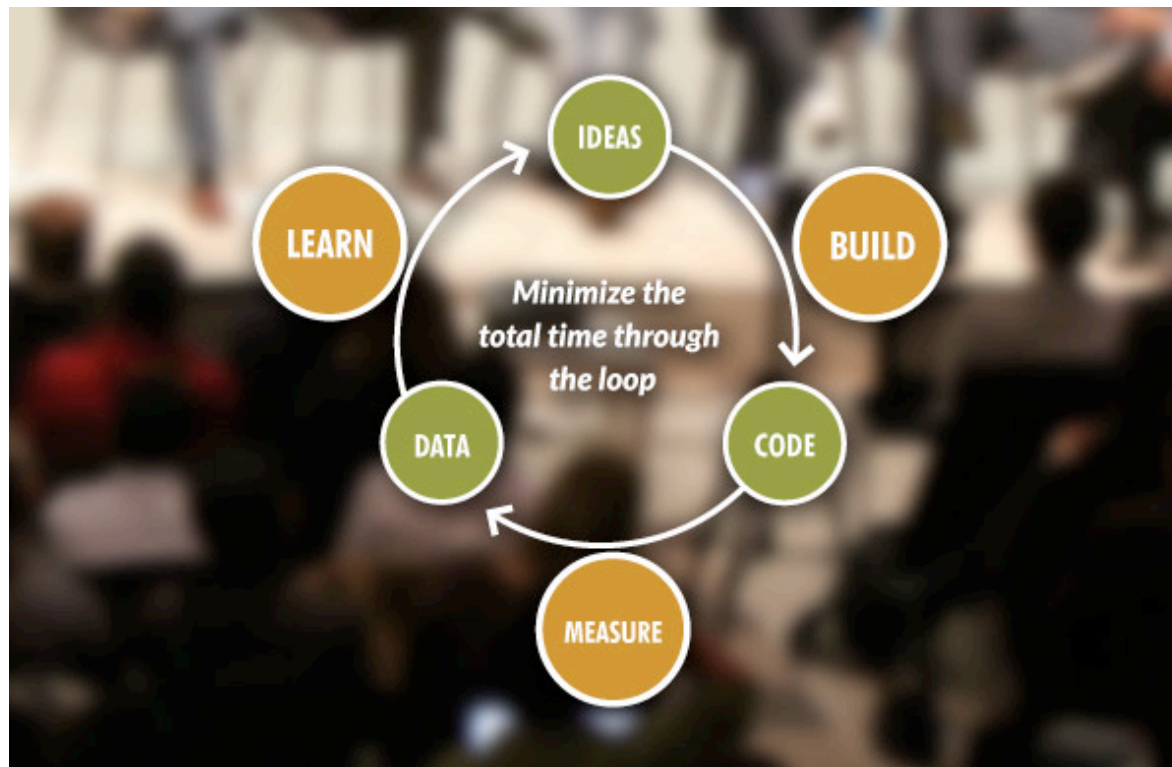

The **Search** for a Business

Goal: Product-Market fit (Discover customers)

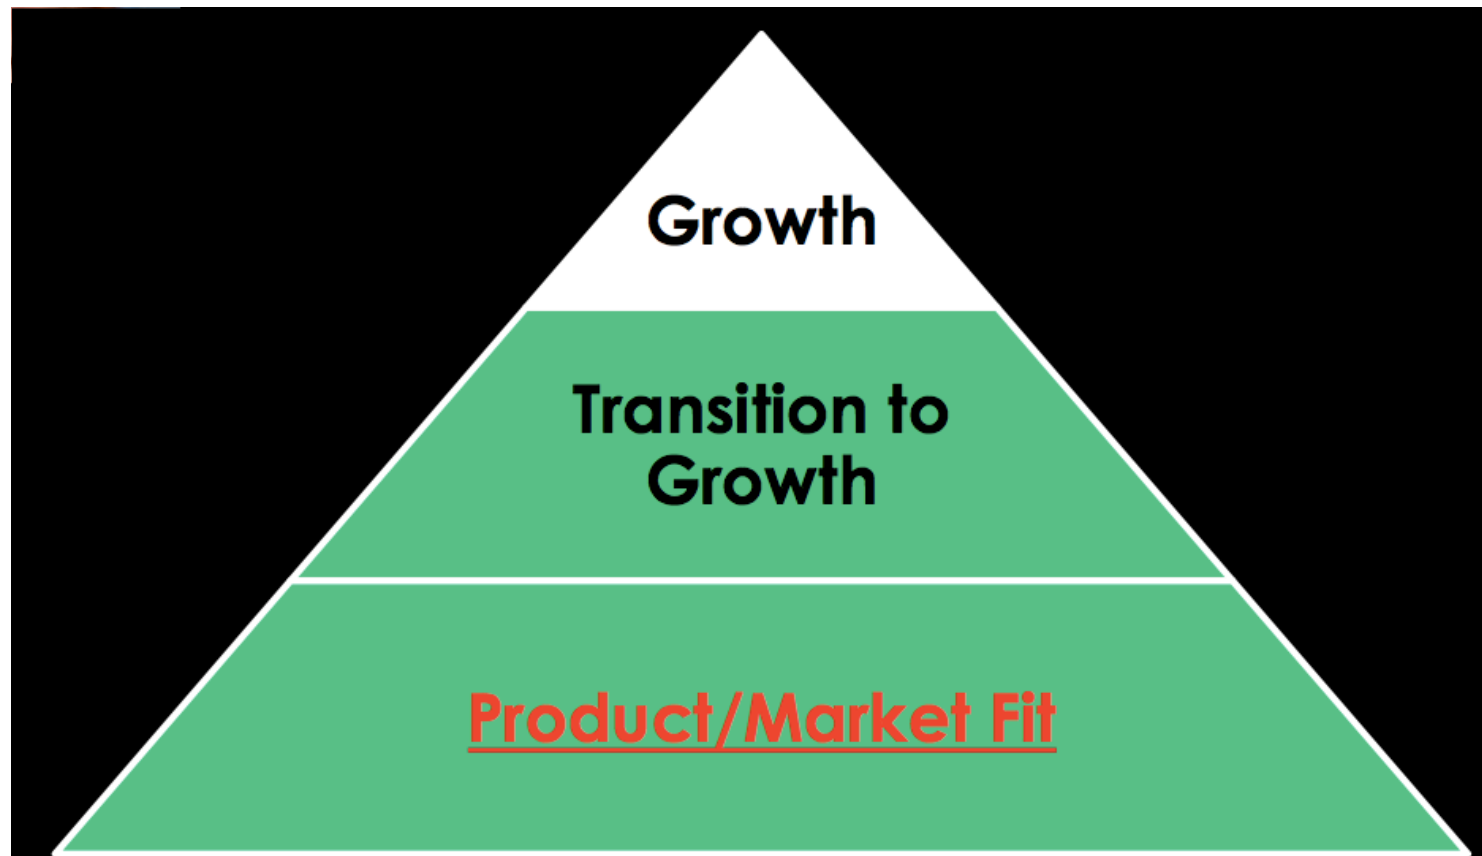

Lean startup process

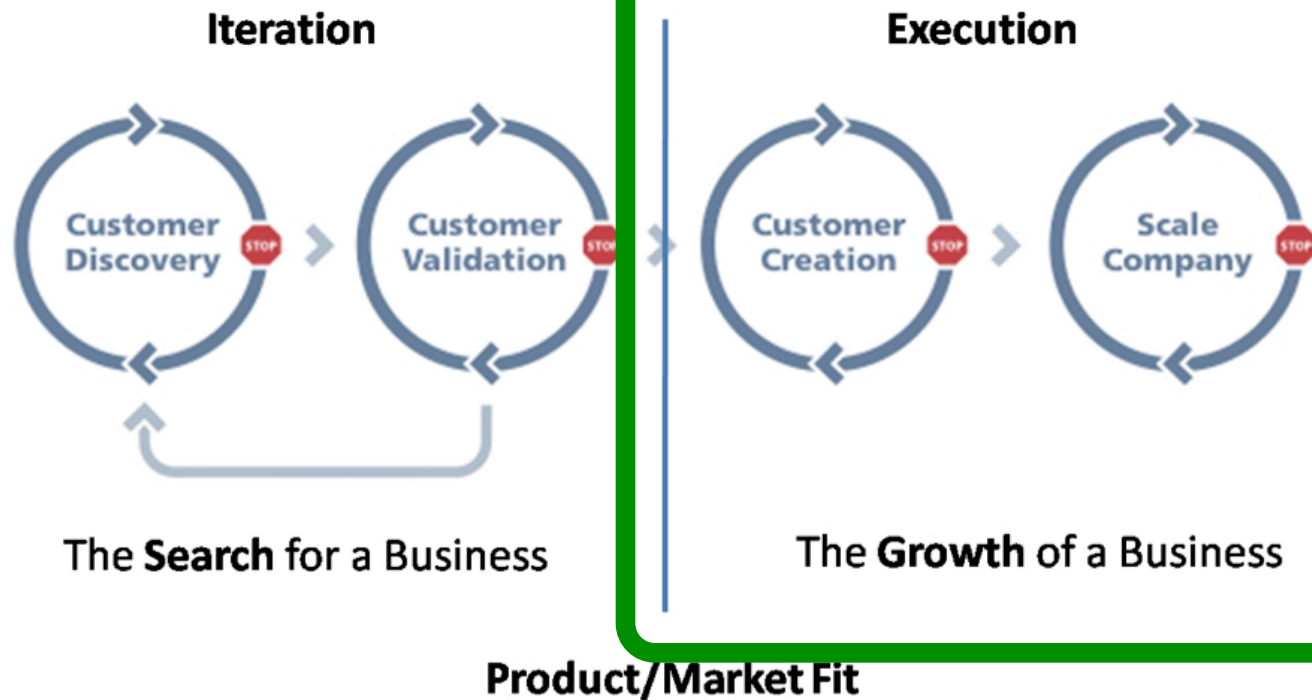

In search of the minimum viable product

Transition to growth

Execute

Where does software engineering fit in?

- Building the prototype
- Iterating to find product/market fit
- Execution to grow the business

Raising capital

- Do you need it to build your prototype?
- Can you bleed through product market fit?
- Growth typically requires money
- Can you get to product/market fit on the cheap?

Angel investors and venture capital

- Infusing capital into your company
- Exchanging ownership for money
- Angels: very early money
- Venture capital: typically later (at product-market fit?)

Some rough ideas

- Can you build a company worth a billion dollars?
- Ten million users is the new one million
- What's your revenue stream going to be?
- Do you have the team?
- Do you have the right idea?
- Do you have competitive advantage?
- Can you execute?

Which brings me back to....

Purple People Eatery

Helping employers find great CSE graduates

Interested?

Incubators and Accelerators

Take aways

- You have a lot of good skills under your belt...both from this class and otherwise
- You have options
 - There's nothing wrong with working for a big company
 - ...but there are other possibilities, including starting a company yourself
- Missing: Business knowledge/experience (The “hustler”)?

Huge opportunity and
lots of excitement...

Software is eating the world.
