# Static Analysis

**Emina Torlak**

[emina@cs.washington.edu](mailto:emina@cs.washington.edu)

# Outline

- What is static analysis?
- How does it work?
- Free and commercial tools

```
public class JavaProgram {  
    public Integer next() {  
        for (int i = p.length - 1; i >= 0; i--)  
            if (++p[i] > n)  
                p[i] = nextInteger(0);  
        else  
            return p;  
    }  
    throw new NoSuchElementException();  
}
```

The image shows a magnifying glass with a black handle and a silver rim, positioned over a snippet of Java code. The code is color-coded: 'public' is purple, 'class' is red, 'Integer' is blue, 'next()' is black, 'for' is black, 'int' is red, 'i' is black, 'p.length' is blue, '1' is black, '>=' is black, '0' is black, ';' is black, 'i--' is black, 'if' is black, '++p[i]' is blue, '>' is black, 'n' is black, 'p[i]' is blue, '=' is black, 'nextInteger(0)' is black, 'else' is black, 'return p;' is black, and 'throw new NoSuchElementException();' is black. The magnifying glass is focused on the 'if' statement and the '++p[i]' expression.

# what

**a brief introduction to static analysis**

# What is static analysis?

- A static analysis tool  $S$  analyzes the source code of a program  $P$  to determine whether it satisfies a property  $\varphi$ , such as
  - “ $P$  never dereferences a null pointer”
  - “ $P$  does not leak file handles”
  - “No cast in  $P$  will lead to a `ClassCastException`”
  - ...

# What is static analysis?

- A static analysis tool  $S$  analyzes the source code of a program  $P$  to determine whether it satisfies a property  $\varphi$ , such as
  - “ $P$  never dereferences a null pointer”
  - “ $P$  does not leak file handles”
  - “No cast in  $P$  will lead to a `ClassCastException`”
  - ...

But it is impossible to write such a tool! For any nontrivial property  $\varphi$ , there is no general automated method to determine whether  $P$  satisfies  $\varphi$  (Rice's theorem).

# What is static analysis?

- A static analysis tool  $S$  analyzes the source code of a program  $P$  to determine whether it satisfies a property  $\varphi$ , such as
  - “ $P$  never dereferences a null pointer”
  - “ $P$  does not leak file handles”
  - “No cast in  $P$  will lead to a `ClassCastException`”
  - ...

But it is impossible to write such a tool! For any nontrivial property  $\varphi$ , there is no general automated method to determine whether  $P$  satisfies  $\varphi$  (Rice's theorem).

So, why are we having this lecture?

# **What is practical static analysis?**

# What is practical static analysis?

- A static analysis tool  $S$  analyzes the source code of a program  $P$  to determine whether it satisfies a property  $\varphi$ , but it can be wrong in one of two ways:

# What is practical static analysis?

- A static analysis tool  $S$  analyzes the source code of a program  $P$  to determine whether it satisfies a property  $\varphi$ , but it can be wrong in one of two ways:
  - If  $S$  is **sound**, it will never miss any violations, but it may say that  $P$  violates  $\varphi$  even though it doesn't (resulting in **false positives**).

# What is practical static analysis?

- A static analysis tool  $S$  analyzes the source code of a program  $P$  to determine whether it satisfies a property  $\varphi$ , but it can be wrong in one of two ways:
  - If  $S$  is **sound**, it will never miss any violations, but it may say that  $P$  violates  $\varphi$  even though it doesn't (resulting in **false positives**).
  - If  $S$  is **complete**, it will never report false positives, but it may miss real violations of  $\varphi$  (resulting in **false negatives**).

# What is practical static analysis?

- A static analysis tool  $S$  analyzes the source code of a program  $P$  to determine whether it satisfies a property  $\varphi$ , but it can be wrong in one of two ways:
  - If  $S$  is **sound**, it will never miss any violations, but it may say that  $P$  violates  $\varphi$  even though it doesn't (resulting in **false positives**).
  - If  $S$  is **complete**, it will never report false positives, but it may miss real violations of  $\varphi$  (resulting in **false negatives**).

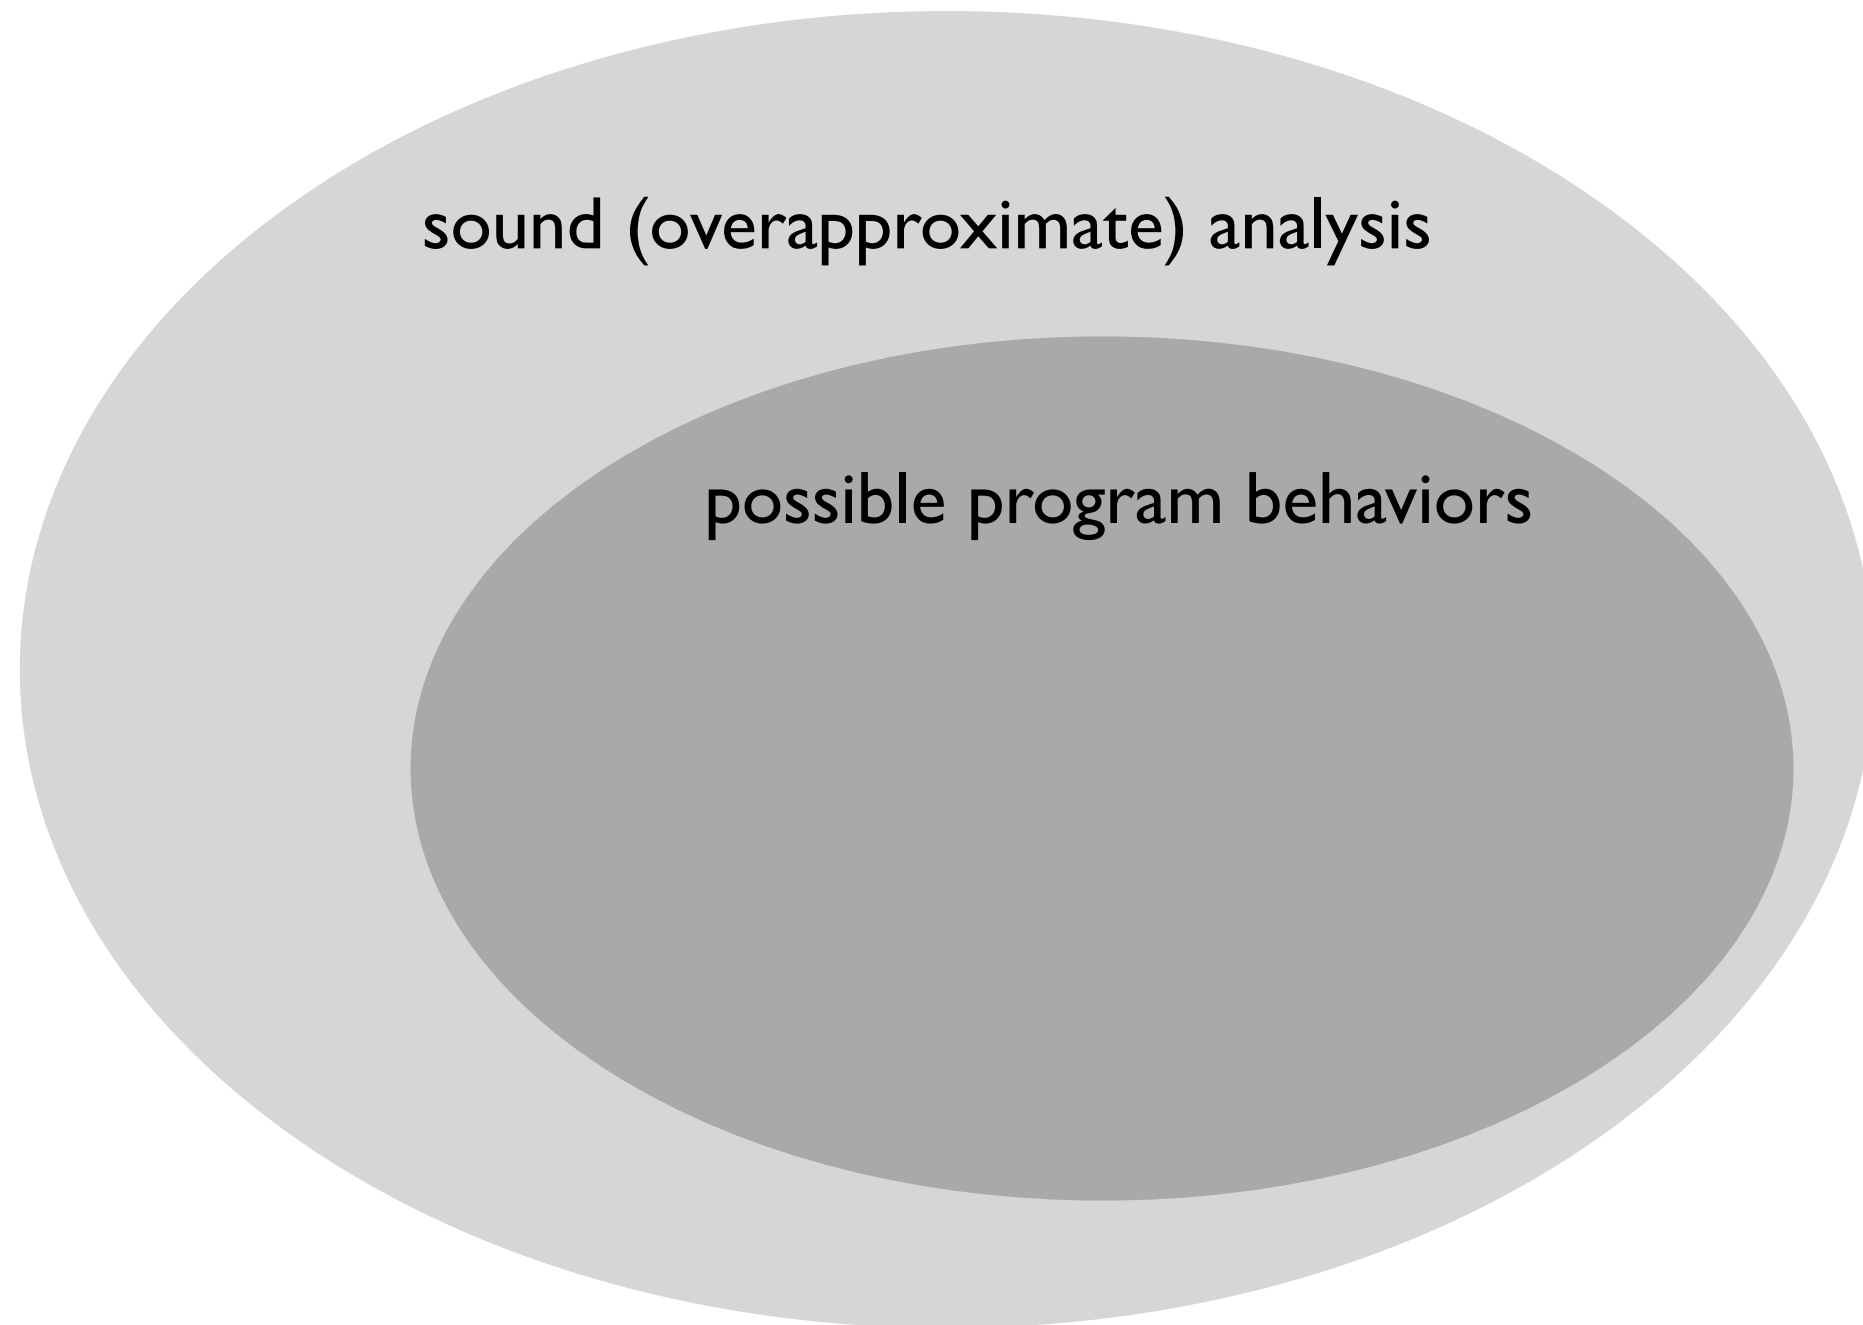

What is a trivial way to implement a sound analysis?  
A complete analysis?

# Soundness vs completeness

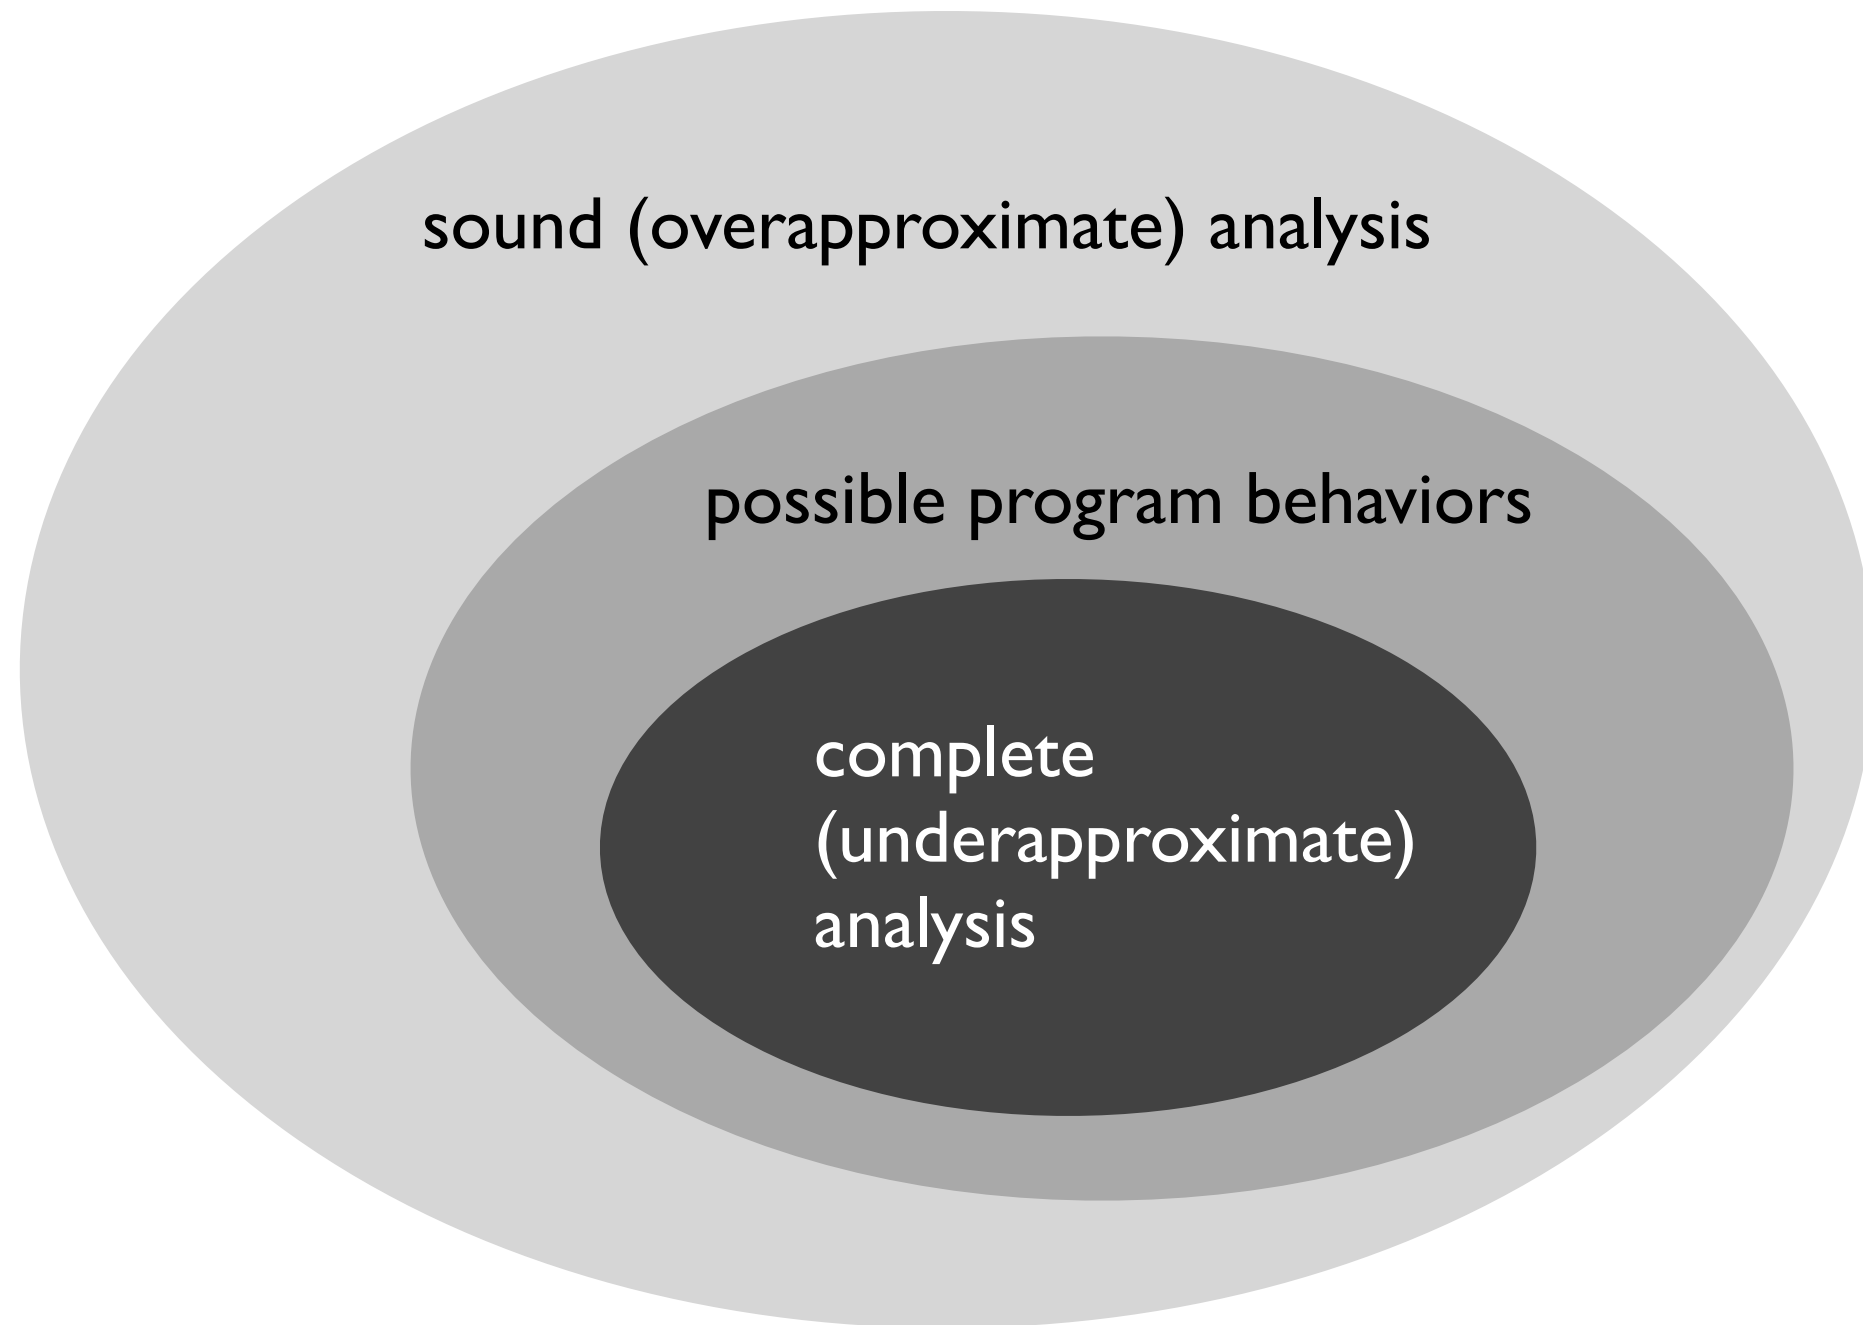

possible program behaviors

# Soundness vs completeness

# Soundness vs completeness

# Applications of static analysis

- Compilers (sound)
  - type checking, liveness analysis, alias analysis, ...
- Bug finding (usually complete)
- Verification (sound)

# how

**static analysis by example**

# **A toy static analysis: find a computation's sign**

# **A toy static analysis: find a computation's sign**

- Given a program  $P$ , determine the sign (positive, negative, or zero) of all of its variables.

# A toy static analysis: find a computation's sign

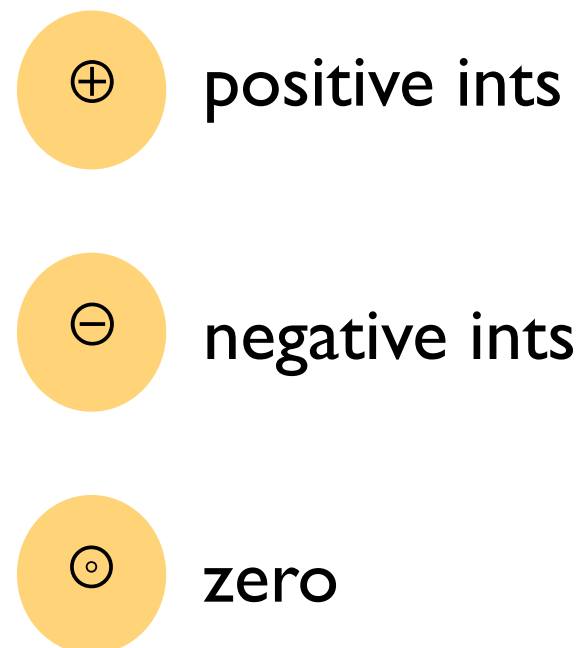

- Given a program  $P$ , determine the sign (positive, negative, or zero) of all of its variables.
- Applications:
  - Check for division by 0
  - Optimize by storing + variables as unsigned integers
  - Check for negative array indices
  - ...

  - $\odot + \odot = \odot$
  - $\oplus + \ominus = \top$
  - $\top / \odot = \perp$
  - ...

# A toy static analysis: an example

```
a = 5;  
b = -3;  
c = a * b;  
d = 0;  
e = c * d;  
f = 10 / e;
```

# A toy static analysis: an example

```
a = ⊕;  
b = -3;  
c = a * b;  
d = 0;  
e = c * d;  
f = 10 / e;
```

# A toy static analysis: an example

```
a = ⊕;  
b = ⊖;  
c = a * b;  
d = 0;  
e = c * d;  
f = 10 / e;
```

# A toy static analysis: an example

```
a = ⊕;  
b = ⊖;  
c = ⊖;  
d = 0;  
e = c * d;  
f = 10 / e;
```

# A toy static analysis: an example

```
a = ⊕;  
b = ⊖;  
c = ⊖;  
d = ⊙;  
e = c * d;  
f = 10 / e;
```

# A toy static analysis: an example

```
a = ⊕;  
b = ⊖;  
c = ⊖;  
d = ⊙;  
e = ⊙;  
f = 10 / e;
```

# A toy static analysis: an example

```
a = ⊕;  
b = ⊖;  
c = ⊖;  
d = ⊙;  
e = ⊙;  
f = ⊥;
```

# A toy static analysis: an example

```
a = ⊕;  
b = ⊖;  
c = ⊖;  
d = ⊙;  
e = ⊙;  
f = ⊥;
```

Detected division by zero!  
Just look for variables that  
the analysis maps to  $\perp$ .

# A toy static analysis: another example

```
a = 5;  
b = -3;  
c = a + b;  
d = 0;  
e = c - d;  
f = 10 / e;
```

# A toy static analysis: another example

```
a = ⊕;  
b = -3;  
c = a + b;  
d = 0;  
e = c - d;  
f = 10 / e;
```

# A toy static analysis: another example

```
a = ⊕;  
b = ⊖;  
c = a + b;  
d = 0;  
e = c - d;  
f = 10 / e;
```

# A toy static analysis: another example

```
a = ⊕;  
b = ⊖;  
c = ⊤;  
d = 0;  
e = c - d;  
f = 10 / e;
```

# A toy static analysis: another example

```
a = ⊕;  
b = ⊖;  
c = ⊤;  
d = ⊙;  
e = c - d;  
f = 10 / e;
```

# A toy static analysis: another example

```
a = ⊕;  
b = ⊖;  
c = ⊤;  
d = ⊙;  
e = ⊤;  
f = 10 / e;
```

# A toy static analysis: another example

```
a = ⊕;  
b = ⊖;  
c = ⊤;  
d = ⊙;  
e = ⊤;  
f = ⊤;
```

# A toy static analysis: another example

```
a = ⊕;  
b = ⊖;  
c = ⊤;  
d = ⊙;  
e = ⊤;  
f = ⊤;
```

False positive! This program can never throw an error, but the analysis reports that `f` may contain any value (including undefined).

**state-of-the-art static analysis tools**

# Some state-of-the-art static analysis tools

- Astree
- Coverity
- Java PathFinder
- ...

# Astree (sound)

- Proves the absence of runtime errors and undefined behavior in C programs.
- Used to prove absence of runtime errors in
  - Airbus flight control software
  - Docking software for the International Space Station
- Many man-years of effort (since 2001) to develop.
- See [www.astree.ens.fr/](http://www.astree.ens.fr/)

# Coverity (neither sound nor complete)

- Looks for bugs in C, C++, Java, and C#.
- Used by
  - >1100 companies.
  - NASA JPL (in addition to many other tools).
- Offered as a free, cloud-based service for open-source projects.
- See [www.coverity.com](http://www.coverity.com)

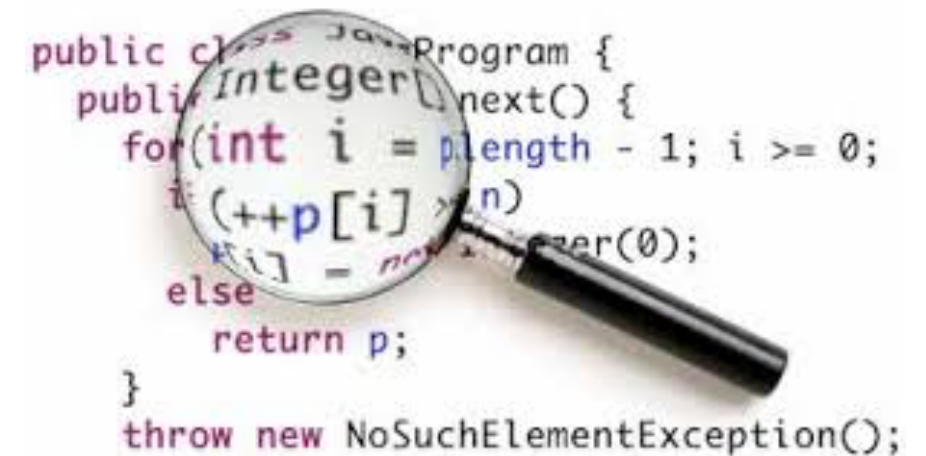

# Java PathFinder (sound but can be imprecise)

- Finds bugs in mission-critical Java code.
- Developed by NASA.
- Focuses on concurrency errors (race conditions), uncaught exceptions.
- Free and open source!
- See [babelfish.arc.nasa.gov/trac/jpf](http://babelfish.arc.nasa.gov/trac/jpf)

# Summary

- Static analysis tools check if a program  $P$  satisfies a property  $\varphi$  by
  - (sound) overapproximation of  $P$
  - (complete) underapproximation of  $P$
- Many uses from compilers to bug finding to verification.
- Many high-quality tools available.

```
public class JavaProgram {  
    public Integer next() {  
        for (int i = p.length - 1; i >= 0; i--)  
            if (++p[i] > n)  
                return Integer(0);  
            else  
                return p;  
    }  
    throw new NoSuchElementException();  
}
```
