Reading and References

- Reference

- » Chapter 10, C Programming on MIPS, *See MIPS Run, D. Sweetman*

Leaf procedures

- A leaf procedure is one that does not call another procedure
- Relatively simple register usage since the procedure doesn't call anyone else
- Little or no memory access requirements because you are not saving and restoring as many registers from the stack

10-Apr-2006

cse410-06-procedures-b © 2006 DW Johnson & University of Washington

3

Non-leaf procedure

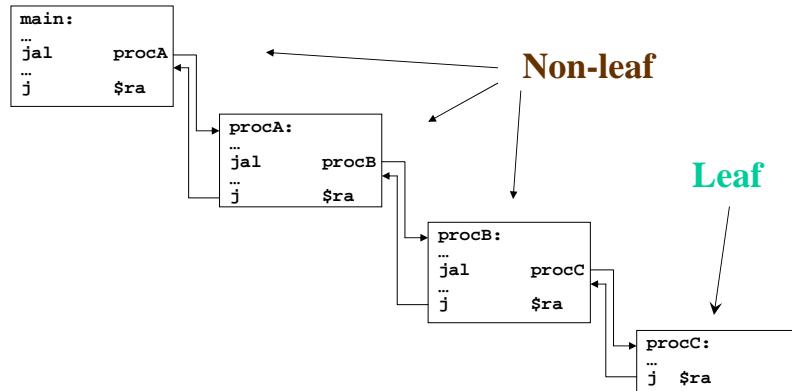

- A non-leaf procedure is one that calls another procedure
- You must save at least register \$ra, since that register is overwritten by the jal when you call another procedure

8

Little leaf example - swap.c

```
/* Swap two integer array elements */

void swap(int a[], int i, int j)
{
    int T;
    T = a[i];
    a[i] = a[j];
    a[j] = T;
}
```

9

Little leaf example - swap.s

```
swap:
    sll    $a1,$a1,2      # $a1 = 4*i
    addu   $a1,$a1,$a0    # $a1 = addr(a[i])
    lw     $v1,0($a1)    # $v1 = a[i]
    sll    $a2,$a2,2      # $a2 = 4*j
    addu   $a2,$a2,$a0    # $a2 = addr(a[j])
    lw     $v0,0($a2)    # $v0 = a[j]
    sw    $v0,0($a1)    # a[i] = old a[j]
    sw    $v1,0($a2)    # a[j] = old a[i]
    j     $ra             # return
```

10-Apr-2006

10

Non-leaf example - QuickSort.c

```
void QuickSort(int a[], int lo0, int hi0)
{
    int lo = lo0;
    int hi = hi0;
    int mid;

    if ( hi0 > lo0)
    {
        ...
    }
```

10-Apr-2006

11

Non-leaf example - QuickSort.s

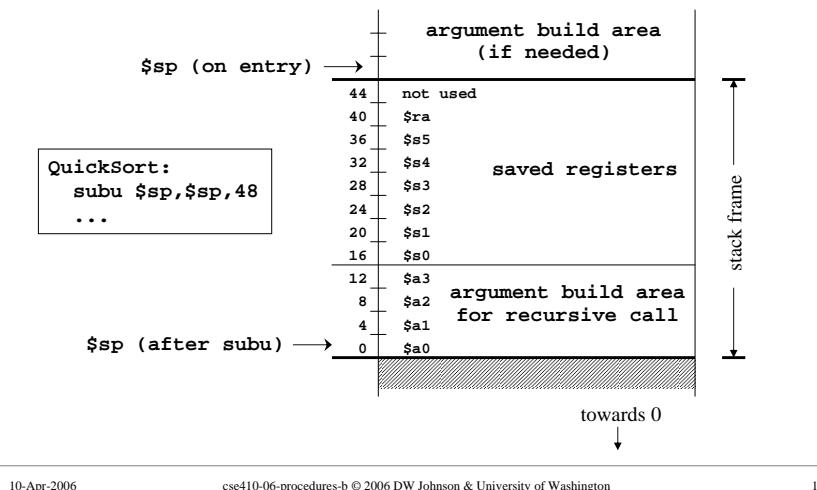

```
QuickSort:
    subu   $sp,$sp,48      # create stack frame
    sw    $ra,40($sp)    #
    sw    $s5,36($sp)    #
    sw    $s4,32($sp)    #
    sw    $s3,28($sp)    #
    sw    $s2,24($sp)    #
    sw    $s1,20($sp)    #
    sw    $s0,16($sp)    #
    move   $s3,$a0        # $s3 = address(a)
    move   $s5,$a1        # $s5 = lo0
    ...
```

13

\$ra - Return Address

- Return address register
 - » written with jal, jalr instructions
 - » must be saved if procedure calls another

QuickSort:

```

subu    $sp,$sp,48    # create stack frame
sw     $ra,40($sp)   #
...
lw     $ra,40($sp)   # restore from stack ...
addu   $sp,$sp,48    #
j      $ra           # return

```

10-Apr-2006

cse410-06-procedures-b © 2006 DW Johnson & University of Washington

14

\$fp - Frame Pointer

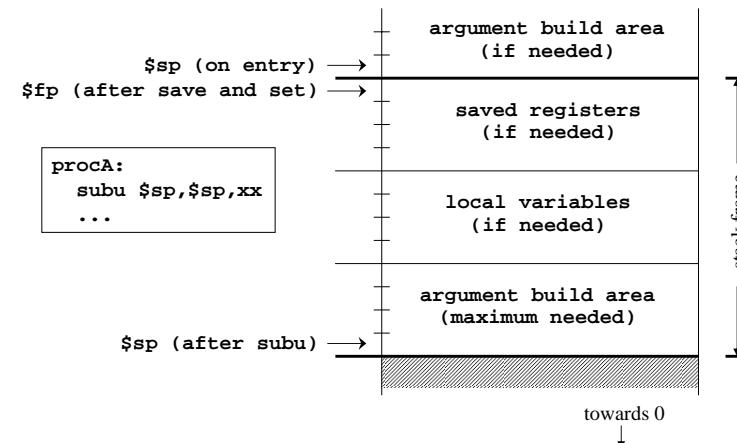

- Frame pointer points to the largest address in the stack frame
- Stack pointer points to the smallest address in the stack frame
 - » no advantage to \$fp if \$sp does not change during procedure's execution
- Consider \$fp to be \$s8
 - » save and restore required if you use it

10-Apr-2006

cse410-06-procedures-b © 2006 DW Johnson & University of Washington

15

Layout of stack frame (with \$fp)

10-Apr-2006

cse410-06-procedures-b © 2006 DW Johnson & University of Washington

16

\$s0-\$s7 - Save and Restore

- These registers are available for unlimited use
- Must save immediately on procedure entry and restore just before procedure exit if you are going to use them
- As a result of this convention, the registers will have the same values after a procedure call as they had before

\$t0-\$t9 - Temporary registers

- Use however you like
- No save and restore required or expected
- As a result of this convention, the registers have no guaranteed values when you get back from calling another procedure

\$a0-\$a3 , \$v0-\$v1 - Args/Return

- The argument registers can be changed in a procedure without restriction
- No guarantee that they will be the same upon return from a called procedure
- The result registers will contain whatever the function prototype says they will
 - » undefined value in \$v1 if not used for return

Pearls of wisdom from Sweetman

- These calling conventions can look very complex
 - » but partly that's just appalling documentation
 - » and the inclusion of debugging conventions
- Most functions that you may write in assembler for tuning reasons will be leaf functions
 - » the declaration of such a function is very simple

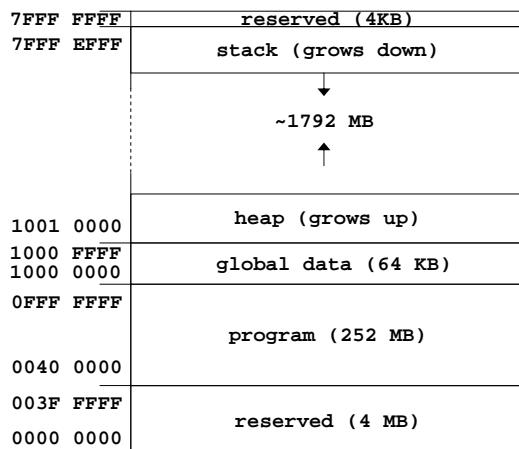

Appendix

21

Layout of program memory

*Not to
Scale!*

10-Apr-2006

cse410-06-procedures-b © 2006 DW Johnson & University of Washington

23

\$gp - Global Pointer

- Initialized so that it points to the middle of a 64KB section of the data segment
 - » address **0x10008000**
- Variables placed in this section can be accessed without loading a 32-bit address
 - » **lw \$t0,-32768(\$gp)**
- Assembler directive
 - » **.extrn symbol bytecount**

10-Apr-2006

cse410-06-procedures-b © 2006 DW Johnson & University of Washington

22

Using the global pointer - gp.s

```
.extern common 4      # global area symbol
.data
local:                 # non-global symbol
.word    0xAAAA        # data value

.text
main:
    lw      $t0,local   # load word
    sw      $t0,common   # store word
    j       $ra           # return
```

10-Apr-2006

cse410-06-procedures-b © 2006 DW Johnson & University of Washington

24

A reference through \$gp

```
# lw    $t0,local  
0x3c011001    lui    $1, 4097  
0x8c280000    lw     $8, 0($1)  
  
# sw    $t0,common  
0xaf888000    sw     $8, -32768($28)
```

0xAF888000 <=> sw \$t0,-32768(\$gp)
