

Topic #13: Grammar

CSE 413, Autumn 2004
Programming Languages

<http://www.cs.washington.edu/education/courses/413/04au/>

1

Classes of Languages

1. Regular languages (finite automata)
2. Context-free languages (push-down automata)
3. Context-sensitive languages (linear bounded automata)
4. Recursively-enumerable languages (Turing machine)

2

Grammar for fm, a little language

1. $program \rightarrow movie\ name\ \{ movieBody\} EOF$
2. $movieBody \rightarrow prologBlock\ pageBlocks\ | pageBlocks$
3. $prologBlock \rightarrow prolog\ \{ prologStatements\}$
4. $prologStatements \rightarrow prologStatement\ | prologStatements\ prologStatement$
5. $prologStatement \rightarrow variableDeclaration$
11. $variableDeclaration \rightarrow id : type();\ | id : type(exprList);$
12. $pageBlocks \rightarrow pageBlock\ | pageBlocks\ pageBlock$
13. $pageBlock \rightarrow show\ (integer)\ \{ pageStatements\}$
14. $pageStatements \rightarrow pageStatement\ | pageStatements\ pageStatement$
15. $pageStatement \rightarrow \{ pageStatements\}\ methodCall;\ | id = expr;\ | if\ (boolExpr)\ pageStatement\ | if\ (boolExpr)\ pageStatement\ else\ pageStatement$
16. $expr \rightarrow term\ | expr + term\ | expr - term$
17. $term \rightarrow factor\ | term * factor\ | term / factor$
18. $factor \rightarrow integer\ | real\ (\ expr)\ | id\ | methodCall$
19. $methodCall \rightarrow id(\ exprList)\ | id.id(\ exprList)$
20. $exprList \rightarrow expr\ | exprList,\ expr$
21. $boolExpr \rightarrow relExpr\ | !(\ relExpr)$
22. $relExpr \rightarrow expr == expr\ | expr > expr\ | expr < expr$
23. $type \rightarrow id$

Grammar for Java, a big language

- The Java™ Language Specification, 2nd Edition
 - » Entire document
 - 500+ pages
 - Grammar productions with explanatory text
 - » Chapter 18, Syntax
 - 8 pages of grammar productions, presented in "BNF-style"

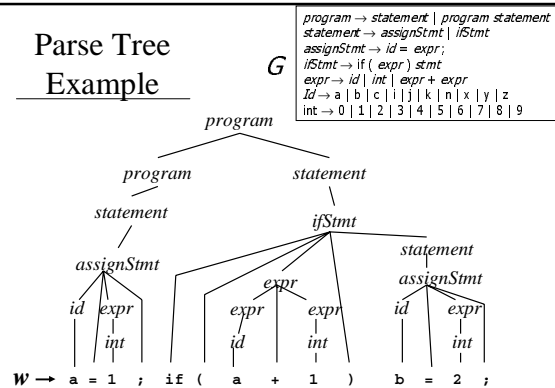

4

Parsing

- The syntax of most programming languages can be specified by a *context-free grammar* (CFG)
- Parsing
 - » Given a grammar G and a sentence w in $L(G)$, traverse the derivation (parse tree) for w in some *standard order* and do *something useful* at each node
 - » The tree might not be produced explicitly, but the control flow of a parser corresponds to a traversal

5

Parse Tree Example

“Standard Order”

- For practical reasons we want the parser to be *deterministic* (no backtracking), and we want to examine the source program from *left to right*.

7

Common Orderings

- Top-down
 - » Start with the root
 - » Traverse the parse tree depth-first, left-to-right (leftmost derivation)
 - » LL(k)
- Bottom-up
 - » Start at leaves and build up to the root
 - Effectively a rightmost derivation in reverse
 - » LR(k)

8

“Something Useful”

- At each point (node) in the traversal, perform some *semantic action*
 - » Construct nodes of full parse tree
 - » Construct abstract syntax tree
 - » Construct linear, lower-level representation
 - » Generate target code on the fly → 1-pass compiler

9

Context-Free Grammars

- Formally, a grammar G is a tuple $\langle N, \Sigma, P, S \rangle$ where
 - » N a finite set of non-terminal symbols
 - » Σ a finite set of terminal symbols
 - » P a finite set of productions
 - A subset of $N \times (N \cup \Sigma)^*$
 - » S the *start symbol*, a distinguished element of N

10

Standard Notations

a, b, c	elements of Σ	<i>terminals</i>
w, x, y, z	elements of Σ^*	<i>strings of terminals</i>
A, B, C	elements of N	<i>non-terminals</i>
X, Y, Z	elements of $N \cup \Sigma$	<i>grammar symbols</i>
α, β, γ	elements of $(N \cup \Sigma)^*$	<i>strings of symbols</i>
$A \rightarrow \alpha$ (or $A ::= \alpha$) if $\langle A, \alpha \rangle$ in P		
"non-terminal A can take the form α "		

11

Derivation Relations

- $\alpha A \gamma \Rightarrow \alpha \beta \gamma$ iff $A \rightarrow \beta$ in P
- $A \Rightarrow^* w$ if there is a chain of productions starting with A that generates w
 - » "Non-terminal A derives the string of terminals w "

12

Derivation Relations

- $w A \gamma \Rightarrow_{lm} w \beta \gamma$ iff $A \rightarrow \beta$ in P
 - » derive by always picking the first non-terminal from the left
- $\alpha A w \Rightarrow_{rm} \alpha \beta w$ iff $A \rightarrow \beta$ in P
 - » derive by always picking the first non-terminal from the right
- We will only be interested in leftmost and rightmost derivations – not random orderings

13

Languages

- For A in N , $L(A) = \{ w \mid A \Rightarrow^* w \}$
 - » for any non-terminal A defined for a grammar, the language generated by A is the set of strings w that can be derived from A using the productions
- If S is the start symbol of grammar G , define $L(G) = L(S)$
 - » The language derived by G is the language derived by the start symbol S

14

Reduced Grammars

- Grammar G is *reduced* iff for every production $A \rightarrow \alpha$ in G there is a derivation $S \Rightarrow^* x A z \Rightarrow x \alpha z \Rightarrow^* xyz$

15

Ambiguity

- Grammar G is *unambiguous* iff every w in $L(G)$ has a unique leftmost (or rightmost) derivation
 - » Fact: unique leftmost or unique rightmost implies the other
- A grammar without this property is *ambiguous*
 - » Note that other grammars that generate the same language may be unambiguous

16

Ambiguous Grammar for Expressions

$$\begin{aligned} \text{expr} &\rightarrow \text{expr} + \text{expr} \mid \text{expr} - \text{expr} \\ &\quad \mid \text{expr} * \text{expr} \mid \text{expr} / \text{expr} \mid \text{int} \\ \text{int} &\rightarrow 0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9 \end{aligned}$$

- Show that this is ambiguous
 - » How? Show two different leftmost or rightmost derivations for the same string
 - » Equivalently: show two different parse trees for the same string

17

Example Derivation

$$\begin{array}{l} \text{expr} \rightarrow \text{expr} + \text{expr} \mid \text{expr} - \text{expr} \\ \quad \mid \text{expr} * \text{expr} \mid \text{expr} / \text{expr} \mid \text{int} \\ \text{int} \rightarrow 0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9 \end{array}$$

Give a leftmost derivation of $2+3*4$ and show the parse tree

Another Derivation

```
expr → expr + expr | expr - expr
      | expr * expr | expr / expr | int
int  → 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9
```

Give a different leftmost derivation of $2+3*4$ and show the parse tree

Another Example

```
expr → expr + expr | expr - expr
      | expr * expr | expr / expr | int
int  → 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9
```

Give two different derivations of $5+6+7$

(extra space)

21

What's going on here?

- The grammar has no notion of precedence or associativity
- Solution
 - » Create a non-terminal for each level of precedence
 - » Isolate the corresponding part of the grammar
 - » Force the parser to recognize higher precedence subexpressions first

22

Classic Expression Grammar

```
expr → expr + term | expr - term | term
term → term * factor | term / factor | factor
factor → int | ( expr )
int → 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7
```

23

Derive $2 + 3 * 4$

```
expr → expr + term | expr - term | term
term → term * factor | term / factor | factor
factor → int | ( expr )
int → 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7
```

Derive $5 + 6 + 7$

```
expr → expr + term | expr - term | term
term → term * factor | term / factor | factor
factor → int | ( expr )
int → 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7
```

Derive $5 + (6 + 7)$

```
expr → expr + term | expr - term | term
term → term * factor | term / factor | factor
factor → int | ( expr )
int → 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7
```

Another Classic Example

- Grammar for conditional statements

```
ifStmt → if ( cond ) stmt
        | if ( cond ) stmt else stmt
```

- » Exercise: show that this is ambiguous
 - How?

27

One Derivation

```
ifStmt → if ( cond ) stmt
        | if ( cond ) stmt else stmt
```

Another Derivation

```
ifStmt → if ( cond ) stmt
        | if ( cond ) stmt else stmt
```

Solving **if** Ambiguity

- Fix the grammar to separate if statements with else clause and if statements with no else
 - » Done in Java reference grammar
 - » Adds lots of non-terminals
- Use some ad-hoc rule in parser
 - » “else matches closest unpaired if”
