## CSE 414

### Lectures 20: Design Theory

# Announcements

- Web quiz due Sunday night
- HW6 (Conceptual design) posted, due next week

# Relational Schema Design

Conceptual Model:

Relational Model:  
plus FD's

Normalization:  
Eliminates **anomalies**

# Relational Schema Design

| Name | <u>SSN</u>  | <u>PhoneNumber</u> | City      |
|------|-------------|--------------------|-----------|
| Fred | 123-45-6789 | 206-555-1234       | Seattle   |
| Fred | 123-45-6789 | 206-555-6543       | Seattle   |
| Joe  | 987-65-4321 | 908-555-2121       | Westfield |

One person may have multiple phones, but lives in only one city

Primary key is thus (SSN,PhoneNumber)

What is the problem with this schema?

# Relational Schema Design

| Name | <u>SSN</u>  | <u>PhoneNumber</u> | City      |
|------|-------------|--------------------|-----------|
| Fred | 123-45-6789 | 206-555-1234       | Seattle   |
| Fred | 123-45-6789 | 206-555-6543       | Seattle   |
| Joe  | 987-65-4321 | 908-555-2121       | Westfield |

## Anomalies:

- Redundancy = repeat data
- Update anomalies = what if Fred moves to “Bellevue”?
- Deletion anomalies = what if Joe deletes his phone number?

# Relation Decomposition

**Break the relation into two:**

| Name | SSN         | PhoneNumber  | City      |
|------|-------------|--------------|-----------|
| Fred | 123-45-6789 | 206-555-1234 | Seattle   |
| Fred | 123-45-6789 | 206-555-6543 | Seattle   |
| Joe  | 987-65-4321 | 908-555-2121 | Westfield |

| Name | <u>SSN</u>  | City      |
|------|-------------|-----------|
| Fred | 123-45-6789 | Seattle   |
| Joe  | 987-65-4321 | Westfield |

| <u>SSN</u>  | <u>PhoneNumber</u> |
|-------------|--------------------|
| 123-45-6789 | 206-555-1234       |
| 123-45-6789 | 206-555-6543       |
| 987-65-4321 | 908-555-2121       |

**Anomalies have gone:**

- No more repeated data
- Easy to move Fred to “Bellevue” (how ?)
- Easy to delete all Joe’s phone numbers (how ?)

# Relational Schema Design (or Logical Design)

How do we do this systematically?

- Start with some relational schema
- Find out its **functional dependencies** (FDs)
- Use FDs to **normalize** the relational schema

# Functional Dependencies (FDs)

## Definition

If two tuples agree on the attributes

$A_1, A_2, \dots, A_n$

then they must also agree on the attributes

$B_1, B_2, \dots, B_m$

Formally:

$A_1 \dots A_n$  **determines**  $B_1 \dots B_m$

$A_1, A_2, \dots, A_n \rightarrow B_1, B_2, \dots, B_m$

# Functional Dependencies (FDs)

**Definition**  $A_1, \dots, A_m \rightarrow B_1, \dots, B_n$  holds in R if:

$\forall t, t' \in R,$

$(t.A_1 = t'.A_1 \wedge \dots \wedge t.A_m = t'.A_m \Rightarrow t.B_1 = t'.B_1 \wedge \dots \wedge t.B_n = t'.B_n)$

| R  |  | $A_1$ | ... | $A_m$ |  | $B_1$ | ... | $B_n$ |  |  |
|----|--|-------|-----|-------|--|-------|-----|-------|--|--|
|    |  |       |     |       |  |       |     |       |  |  |
| t  |  |       |     |       |  |       |     |       |  |  |
|    |  |       |     |       |  |       |     |       |  |  |
| t' |  |       |     |       |  |       |     |       |  |  |
|    |  |       |     |       |  |       |     |       |  |  |

if  $t, t'$  agree here then  $t, t'$  agree here

# Example

An FD holds, or does not hold on an instance:

| <b>EmpID</b> | <b>Name</b> | <b>Phone</b> | <b>Position</b> |
|--------------|-------------|--------------|-----------------|
| E0045        | Smith       | 1234         | Clerk           |
| E3542        | Mike        | 9876         | Salesrep        |
| E1111        | Smith       | 9876         | Salesrep        |
| E9999        | Mary        | 1234         | Lawyer          |

EmpID → Name, Phone, Position

Position → Phone

but not Phone → Position

# Example

| EmpID | Name  | Phone  | Position |
|-------|-------|--------|----------|
| E0045 | Smith | 1234   | Clerk    |
| E3542 | Mike  | 9876 ← | Salesrep |
| E1111 | Smith | 9876 ← | Salesrep |
| E9999 | Mary  | 1234   | Lawyer   |

Position → Phone

# Example

| EmpID | Name  | Phone  | Position |
|-------|-------|--------|----------|
| E0045 | Smith | 1234 → | Clerk    |
| E3542 | Mike  | 9876   | Salesrep |
| E1111 | Smith | 9876   | Salesrep |
| E9999 | Mary  | 1234 → | Lawyer   |

But not Phone → Position

# Example

name  $\rightarrow$  color  
category  $\rightarrow$  department  
color, category  $\rightarrow$  price

| name    | category | color | department | price |
|---------|----------|-------|------------|-------|
| Gizmo   | Gadget   | Green | Toys       | 49    |
| Tweaker | Gadget   | Green | Toys       | 99    |

Do all the FDs hold on this instance?

# Example

name → color  
category → department  
color, category → price

| name    | category   | color | department    | price |
|---------|------------|-------|---------------|-------|
| Gizmo   | Gadget     | Green | Toys          | 49    |
| Tweaker | Gadget     | Black | Toys          | 99    |
| Gizmo   | Stationary | Green | Office-suppl. | 59    |

What about this one ?

# Terminology

- FD **holds** or **does not hold** on an instance
- If we can be sure that *every instance of R* will be one in which a given FD is true, then we say that **R satisfies the FD**
- If we say that R satisfies an FD F, we are **stating a constraint on R**

# An Interesting Observation

If all these FDs are true:

$\text{name} \rightarrow \text{color}$   
 $\text{category} \rightarrow \text{department}$   
 $\text{color, category} \rightarrow \text{price}$

Then this FD also holds:

$\text{name, category} \rightarrow \text{price}$

If we find out from application domain that a relation satisfies some FDs, it doesn't mean that we found all the FDs that it satisfies! There could be more FDs implied by the ones we have.

# Closure of a set of Attributes

**Given** a set of attributes  $A_1, \dots, A_n$

The **closure**,  $\{A_1, \dots, A_n\}^+$  = the set of attributes  $B$   
s.t.  $A_1, \dots, A_n \rightarrow B$

Example:

1.  $\text{name} \rightarrow \text{color}$
2.  $\text{category} \rightarrow \text{department}$
3.  $\text{color}, \text{category} \rightarrow \text{price}$

Closures:

$$\text{name}^+ = \{\text{name}, \text{color}\}$$

$$\{\text{name}, \text{category}\}^+ = \{\text{name}, \text{category}, \text{color}, \text{department}, \text{price}\}$$

$$\text{color}^+ = \{\text{color}\}$$

# Closure Algorithm

$X = \{A_1, \dots, A_n\}$ .

**Repeat until** X doesn't change **do:**  
  **if**  $B_1, \dots, B_n \rightarrow C$  is a FD **and**  
     $B_1, \dots, B_n$  are all in X  
  **then** add C to X.

Example:

1. name  $\rightarrow$  color
2. category  $\rightarrow$  department
3. color, category  $\rightarrow$  price

$\{\text{name, category}\}^+ =$   
  { name, category, color, department, price }

Hence: name, category  $\rightarrow$  color, department, price

# Example

In class:

$R(A, B, C, D, E, F)$

|      |   |   |
|------|---|---|
| A, B | → | C |
| A, D | → | E |
| B    | → | D |
| A, F | → | B |

Compute  $\{A, B\}^+$      $X = \{A, B, C, D, E\}$

Compute  $\{A, F\}^+$      $X = \{A, F,$      $\}$

# Example

In class:

$R(A, B, C, D, E, F)$

|      |   |   |
|------|---|---|
| A, B | → | C |
| A, D | → | E |
| B    | → | D |
| A, F | → | B |

Compute  $\{A, B\}^+$      $X = \{A, B, C, D, E\}$

Compute  $\{A, F\}^+$      $X = \{A, F, B, C, D, E\}$

# Example

In class:

$R(A, B, C, D, E, F)$

|      |   |   |
|------|---|---|
| A, B | → | C |
| A, D | → | E |
| B    | → | D |
| A, F | → | B |

Compute  $\{A, B\}^+$      $X = \{A, B, C, D, E\}$

Compute  $\{A, F\}^+$      $X = \{A, F, B, C, D, E\}$

# Practice at Home

Find all FD's implied by:

|      |   |   |
|------|---|---|
| A, B | → | C |
| A, D | → | B |
| B    | → | D |

# Practice at Home

Find all FD's implied by:

|                      |
|----------------------|
| $A, B \rightarrow C$ |
| $A, D \rightarrow B$ |
| $B \rightarrow D$    |

Step 1: Compute  $X^+$ , for every  $X$ :

$A^+ = A, B^+ = BD, C^+ = C, D^+ = D$

$AB^+ = ABCD, AC^+ = AC, AD^+ = ABCD,$

$BC^+ = BCD, BD^+ = BD, CD^+ = CD$

$ABC^+ = ABD^+ = ACD^+ = ABCD$  (no need to compute— why ?)

$BCD^+ = BCD, ABCD^+ = ABCD$

# Practice at Home

Find all FD's implied by:

|                      |
|----------------------|
| $A, B \rightarrow C$ |
| $A, D \rightarrow B$ |
| $B \rightarrow D$    |

Step 1: Compute  $X^+$ , for every  $X$ :

$A^+ = A, B^+ = BD, C^+ = C, D^+ = D$

$AB^+ = ABCD, AC^+ = AC, AD^+ = ABCD,$

$BC^+ = BCD, BD^+ = BD, CD^+ = CD$

$ABC^+ = ABD^+ = ACD^+ = ABCD$  (no need to compute— why ?)

$BCD^+ = BCD, ABCD^+ = ABCD$

Step 2: Enumerate all FD's  $X \rightarrow Y$ , s.t.  $Y \subseteq X^+$  and  $X \cap Y = \emptyset$ :

$AB \rightarrow CD, AD \rightarrow BC, ABC \rightarrow D, ABD \rightarrow C, ACD \rightarrow B$

# Keys

- A **superkey** is a set of attributes  $A_1, \dots, A_n$  s.t. for any other attribute  $B$ , we have  $A_1, \dots, A_n \rightarrow B$
- A **key** is a minimal superkey
  - A superkey and for which no subset is a superkey

# Computing (Super)Keys

- For all sets  $X$ , compute  $X^+$
- If  $X^+ = [\text{all attributes}]$ , then  $X$  is a superkey
- Try only the minimal  $X$ 's to get the keys

# Example

Product(name, price, category, color)

name, category  $\rightarrow$  price  
category  $\rightarrow$  color

What is the key ?

# Example

Product(name, price, category, color)

name, category  $\rightarrow$  price  
category  $\rightarrow$  color

What is the key ?

$(\text{name, category}) + = \{ \text{name, category, price, color} \}$

Hence (name, category) is a key

# Key or Keys ?

Can we have more than one key ?

Given  $R(A,B,C)$  define FD's s.t. there are two or more keys

# Key or Keys ?

Can we have more than one key ?

Given  $R(A,B,C)$  define FD's s.t. there are two or more keys

|                   |
|-------------------|
| $A \rightarrow B$ |
| $B \rightarrow C$ |
| $C \rightarrow A$ |

or

|                    |
|--------------------|
| $AB \rightarrow C$ |
| $BC \rightarrow A$ |

or

|                    |
|--------------------|
| $A \rightarrow BC$ |
| $B \rightarrow AC$ |

what are the keys here ?

# Eliminating Anomalies

| Name | SSN         | PhoneNumber  | City      |
|------|-------------|--------------|-----------|
| Fred | 123-45-6789 | 206-555-1234 | Seattle   |
| Fred | 123-45-6789 | 206-555-6543 | Seattle   |
| Joe  | 987-65-4321 | 908-555-2121 | Westfield |
| Joe  | 987-65-4321 | 908-555-1234 | Westfield |

SSN → Name, City

What is the key?

Suggest a rule for decomposing the table to eliminate anomalies

# Eliminating Anomalies

Main idea:

- $X \rightarrow A$  is OK if  $X$  is a (super)key
- $X \rightarrow A$  is not OK otherwise
  - Need to decompose the table, but how?

# Boyce-Codd Normal Form

There are no  
“bad” FDs:

**Definition.** A relation  $R$  is in BCNF if:

Whenever  $X \rightarrow B$  is a non-trivial dependency,  
then  $X$  is a superkey.

Equivalently:

**Definition.** A relation  $R$  is in BCNF if:

$\forall X$ , either  $X^+ = X$  or  $X^+ = [\text{all attributes}]$

# BCNF Decomposition Algorithm

Normalize(R)

find  $X$  s.t.:  $X \neq X^+ \neq$  [all attributes]

**if** (not found) **then** “R is in BCNF”

**let**  $Y = X^+ - X$ ;  $Z =$  [all attributes] -  $X^+$

decompose R into  $R_1(X \cup Y)$  and  $R_2(X \cup Z)$

Normalize( $R_1$ ); Normalize( $R_2$ );

# Example

| Name | SSN         | PhoneNumber  | City      |
|------|-------------|--------------|-----------|
| Fred | 123-45-6789 | 206-555-1234 | Seattle   |
| Fred | 123-45-6789 | 206-555-6543 | Seattle   |
| Joe  | 987-65-4321 | 908-555-2121 | Westfield |
| Joe  | 987-65-4321 | 908-555-1234 | Westfield |

$SSN \rightarrow Name, City$

The only key is:  $\{SSN, PhoneNumber\}$

Hence  $SSN \rightarrow Name, City$  is a “bad” dependency

In other words:

$SSN^+ = Name, City$  and is neither  $SSN$  nor All Attributes

# Example BCNF Decomposition

| <u>Name</u> | <u>SSN</u>  | <u>City</u> |
|-------------|-------------|-------------|
| Fred        | 123-45-6789 | Seattle     |
| Joe         | 987-65-4321 | Westfield   |

$SSN \rightarrow Name, City$

| <u>SSN</u>  | <u>PhoneNumber</u> |
|-------------|--------------------|
| 123-45-6789 | 206-555-1234       |
| 123-45-6789 | 206-555-6543       |
| 987-65-4321 | 908-555-2121       |
| 987-65-4321 | 908-555-1234       |

Let's check anomalies:

- Redundancy ?
- Update ?
- Delete ?

Find  $X$  s.t.:  $X \neq X^+ \neq [\text{all attributes}]$

# Example BCNF Decomposition

Person(name, SSN, age, hairColor, phoneNumber)

SSN  $\rightarrow$  name, age

age  $\rightarrow$  hairColor

Find  $X$  s.t.:  $X \neq X^+ \neq [\text{all attributes}]$

# Example BCNF Decomposition

Person(name, SSN, age, hairColor, phoneNumber)

SSN  $\rightarrow$  name, age

age  $\rightarrow$  hairColor

Iteration 1: **Person**: SSN<sup>+</sup> = SSN, name, age, hairColor

Decompose into: **P**(SSN, name, age, hairColor)

**Phone**(SSN, phoneNumber)

Find  $X$  s.t.:  $X \neq X^+ \neq [\text{all attributes}]$

# Example BCNF Decomposition

Person(name, SSN, age, hairColor, phoneNumber)

SSN  $\rightarrow$  name, age

age  $\rightarrow$  hairColor

What are  
the keys ?

Iteration 1: **Person**: SSN<sup>+</sup> = SSN, name, age, hairColor

Decompose into: **P**(SSN, name, age, hairColor)

Phone(SSN, phoneNumber)

Iteration 2: **P**: age<sup>+</sup> = age, hairColor

Decompose: **People**(SSN, name, age)

Hair(age, hairColor)

Phone(SSN, phoneNumber)

Find  $X$  s.t.:  $X \neq X^+ \neq [\text{all attributes}]$

# Example BCNF Decomposition

Person(name, SSN, age, hairColor, phoneNumber)

SSN  $\rightarrow$  name, age

age  $\rightarrow$  hairColor

Note the keys!

Iteration 1: **Person**: SSN<sup>+</sup> = SSN, name, age, hairColor

Decompose into: **P**(SSN, name, age, hairColor)

**Phone**(SSN, phoneNumber)

Iteration 2: **P**: age<sup>+</sup> = age, hairColor

Decompose: **People**(SSN, name, age)

**Hair**(age, hairColor)

**Phone**(SSN, phoneNumber)

$R(A,B,C,D)$

# Practice at Home

|                   |
|-------------------|
| $A \rightarrow B$ |
| $B \rightarrow C$ |

$R(A,B,C,D)$   
 $A^+ = ABC \neq ABCD$

$R(A,B,C,D)$

$A \rightarrow B$   
 $B \rightarrow C$

## Practice at Home

What happens if in  $R$  we first pick  $B^+$  ? Or  $AB^+$  ?

# Schema Refinements = Normal Forms

- 1st Normal Form = all tables are flat
- 2nd Normal Form = obsolete
- Boyce Codd Normal Form = today
- 3rd Normal Form = see book

# Goal: Find ALL Functional Dependencies

- Anomalies occur when certain “bad” FDs hold
- We know some of the FDs
- Need to find *all* FDs
- Then look for the bad ones

# Armstrong's Rules (1/3)

$$A_1, A_2, \dots, A_n \rightarrow B_1, B_2, \dots, B_m$$

Is equivalent to

**Splitting rule  
and  
Combining rule**

$$\begin{array}{l} A_1, A_2, \dots, A_n \rightarrow B_1 \\ A_1, A_2, \dots, A_n \rightarrow B_2 \\ \dots \dots \dots \\ A_1, A_2, \dots, A_n \rightarrow B_m \end{array}$$

|  |       |     |       |  |       |     |       |  |
|--|-------|-----|-------|--|-------|-----|-------|--|
|  | $A_1$ | ... | $A_m$ |  | $B_1$ | ... | $B_m$ |  |
|  |       |     |       |  |       |     |       |  |
|  |       |     |       |  |       |     |       |  |
|  |       |     |       |  |       |     |       |  |
|  |       |     |       |  |       |     |       |  |
|  |       |     |       |  |       |     |       |  |
|  |       |     |       |  |       |     |       |  |

# Armstrong's Rules (2/3)

$$A_1, A_2, \dots, A_n \rightarrow A_i$$

**Trivial Rule**

where  $i = 1, 2, \dots, n$

Why ?

|  |       |         |       |  |
|--|-------|---------|-------|--|
|  | $A_1$ | $\dots$ | $A_m$ |  |
|  |       |         |       |  |
|  |       |         |       |  |
|  |       |         |       |  |
|  |       |         |       |  |
|  |       |         |       |  |

# Armstrong's Rules (3/3)

## Transitive Rule

If

$$A_1, A_2, \dots, A_n \rightarrow B_1, B_2, \dots, B_m$$

and

$$B_1, B_2, \dots, B_m \rightarrow C_1, C_2, \dots, C_p$$

then

$$A_1, A_2, \dots, A_n \rightarrow C_1, C_2, \dots, C_p$$

Why ?

# Armstrong's Rules (3/3)

## Illustration

|  | $A_1$ | ... | $A_m$ |  | $B_1$ | ... | $B_m$ |  | $C_1$ | ... | $C_p$ |  |
|--|-------|-----|-------|--|-------|-----|-------|--|-------|-----|-------|--|
|  |       |     |       |  |       |     |       |  |       |     |       |  |
|  |       |     |       |  |       |     |       |  |       |     |       |  |
|  |       |     |       |  |       |     |       |  |       |     |       |  |
|  |       |     |       |  |       |     |       |  |       |     |       |  |
|  |       |     |       |  |       |     |       |  |       |     |       |  |

# Example (continued)

Start from the following FDs:

1. name  $\rightarrow$  color
2. category  $\rightarrow$  department
3. color, category  $\rightarrow$  price

Infer the following FDs:

| Inferred FD                                     | Which Rule did we apply ? |
|-------------------------------------------------|---------------------------|
| 4. name, category $\rightarrow$ name            |                           |
| 5. name, category $\rightarrow$ color           |                           |
| 6. name, category $\rightarrow$ category        |                           |
| 7. name, category $\rightarrow$ color, category |                           |
| 8. name, category $\rightarrow$ price           |                           |

# Example (continued)

Answers:

1. name  $\rightarrow$  color
2. category  $\rightarrow$  department
3. color, category  $\rightarrow$  price

| Inferred FD                                     | Which Rule did we apply ? |
|-------------------------------------------------|---------------------------|
| 4. name, category $\rightarrow$ name            | Trivial rule              |
| 5. name, category $\rightarrow$ color           | Transitivity on 4, 1      |
| 6. name, category $\rightarrow$ category        | Trivial rule              |
| 7. name, category $\rightarrow$ color, category | Split/combine on 5, 6     |
| 8. name, category $\rightarrow$ price           | Transitivity on 3, 7      |

THIS IS TOO HARD ! Let's see an easier way.
