Introduction to Database Systems CSE 414

Lectures 9-10: Relational Algebra

Announcements

Webquiz 3 due Monday night, 11 pm

- HW3 due Wednesday night, 11 pm
 - Log on to your Azure account by now

Today's lecture: secs. 2.4 and 5.1

Where We Are

- Motivation for using a DBMS for managing data
- SQL, SQL, SQL
 - Declaring the schema for our data (CREATE TABLE)
 - Inserting data one row at a time or in bulk (INSERT/.import)
 - Modifying the schema and updating the data (ALTER/UPDATE)
 - Querying the data (SELECT)
 - Tuning queries (CREATE INDEX)
- Next step: More knowledge of how DBMSs work
 - Client-server architecture
 - Relational algebra and query execution

Query Evaluation Steps

SQL query Parse & Check Query Check syntax, Translate query access control, string into internal table names, etc. representation Decide how best to answer query: query optimization **Query Execution** Query **Evaluation** Return Results

The WHAT and the HOW

- SQL = WHAT we want to get form the data
- Relational Algebra = HOW to get the data we want
- The passage from WHAT to HOW is called query optimization

Overview: SQL = WHAT

Product(<u>pid</u>, name, price) Purchase(<u>pid</u>, <u>cid</u>, store) Customer(<u>cid</u>, name, city)

SELECT DISTINCT x.name, z.name
FROM Product x, Purchase y, Customer z
WHERE x.pid = y.pid and y.cid = z.cid and
x.price > 100 and z.city = 'Seattle'

It's clear WHAT we want, unclear HOW to get it

Overview: Relational Algebra = HOW

Final answer Product(pid, name, price) Purchase(pid, cid, store) T4(name,name) Customer(cid, name, city) x.name,z.name T3(...) T2(. . . .) σ price>100 and city='Seattle' T1(pid,name,price,pid,cid,store) But a lot of cid=cid physical details **Execution order** are still left open! pid=pid is now clearly Customer specified 7 **Purchase Product**

Relational Algebra

Sets v.s. Bags

- Sets: {a,b,c}, {a,d,e,f}, { }, . . .
- Bags: {a, a, b, c}, {b, b, b, b, b}, . . .

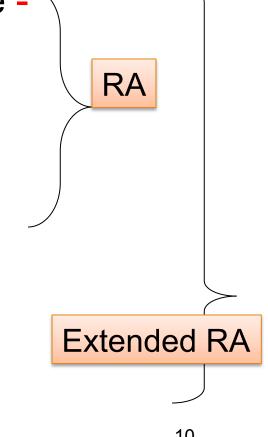

Relational Algebra has two semantics:

- Set semantics = standard Relational Algebra
- Bag semantics = extended Relational Algebra

DB systems implement bag semantics (Why?)

Relational Algebra Operators

- Union ∪, intersection ∩, difference -
- Selection σ
- Projection □
- Cartesian product x, join ⋈
- Rename p
- Duplicate elimination **\delta**
- Grouping and aggregation y
- Sorting τ

Union and Difference

R1 ∪ **R2**

R1 - R2

What do they mean over bags?

What about Intersection?

Derived operator using minus

$$R1 \cap R2 = R1 - (R1 - R2)$$

Derived using join (will explain later)

$$R1 \cap R2 = R1 \bowtie R2$$

Selection

Returns all tuples which satisfy a condition

- Examples
 - $-\sigma_{\text{Salary} > 40000}$ (Employee)
 - $-\sigma_{\text{name = "Smith"}}$ (Employee)
- The condition c can be =, <, ≤, >, ≥, <>

Employee

SSN	Name	Salary
1234545	John	20000
5423341	Smith	60000
4352342	Fred	50000

$\sigma_{\text{Salary} > 40000}$ (Employee)

SSN	Name	Salary
5423341	Smith	60000
4352342	Fred	50000

Projection

Eliminates columns

$$\Pi_{A1,...,An}(R)$$

- Example: project social-security number and names:
 - $-\Pi_{SSN. Name}$ (Employee)
 - Answer(SSN, Name)

Different semantics over sets or bags! Why?

Employee

SSN	Name	Salary
1234545	John	20000
5423341	John	60000
4352342	John	20000

$\Pi_{\text{ Name,Salary}} \text{ (Employee)}$

Name	Salary
John	20000
John	60000
John	20000

Name	Salary
John	20000
John	60000

Bag semantics

Set semantics

Which is more efficient?

Composing RA Operators

Patient

no	name	zip	disease
1	p1	98125	flu
2	p2	98125	heart
3	р3	98120	lung
4	p4	98120	heart

$$\pi_{zip,disease}(Patient)$$

zip	disease
98125	flu
98125	heart
98120	lung
98120	heart

$$\sigma_{disease='heart'}(Patient)$$

no	name	zip	disease
2	p2	98125	heart
4	p4	98120	heart

$$\pi_{zip} \left(\sigma_{disease='heart'}(Patient)\right)$$

zip
98120
98125

Cartesian Product

Each tuple in R1 with each tuple in R2

Rare in practice; mainly used to express joins

Cross-Product Example

Employee

Name	SSN
John	99999999
Tony	77777777

Dependent

EmpSSN	DepName	
99999999	Emily	
77777777	Joe	

Employee × Dependent

Name	SSN	EmpSSN	DepName
John	99999999	99999999	Emily
John	99999999	77777777	Joe
Tony	77777777	99999999	Emily
Tony	77777777	77777777	Joe

Renaming

Changes the schema, not the instance

- Example:
 - $-\rho_{N, S}(Employee) \rightarrow Answer(N, S)$

Not really used by systems, but needed on paper

Natural Join

R1 ⋈ R2

• Meaning: $R1 \bowtie R2 = \Pi_A(\sigma(R1 \times R2))$

- Where:
 - Selection σ checks equality of all common attributes
 - Projection eliminates duplicate common attributes

Natural Join Example

R

Α	В
Х	Υ
Х	Z
Υ	Z
Z	V

S

В	С
Z	U
V	W
Z	V

 $R \bowtie S =$

$$\Pi_{ABC}(\sigma_{R.B=S.B}(R \times S))$$

Α	В	С
Х	Z	U
X	Z	V
Υ	Z	U
Υ	Z	V
Z	V	W

Natural Join Example 2

AnonPatient P

age	age zip disea	
54	98125	heart
20	98120	flu

Voters V

name	age	zip
p1	54	98125
p2	20	98120

$P \bowtie V$

age	zip	disease	name
54	98125	heart	p1
20	98120	flu	p2

Natural Join

Given schemas R(A, B, C, D), S(A, C, E),
 what is the schema of R ⋈ S?

Given R(A, B, C), S(D, E), what is R ⋈ S ?

• Given R(A, B), S(A, B), what is R⋈S?

Theta Join

A join that involves a predicate

$$R1 \bowtie_{\theta} R2 = \sigma_{\theta} (R1 \times R2)$$

- Here θ can be any condition
- For our voters/disease example:

Equijoin

• A theta join where θ is an equality

$$R1 \bowtie_{A=B} R2 = \sigma_{A=B} (R1 \times R2)$$

 This is by far the most used variant of join in practice

Equijoin Example

AnonPatient P

age	ge zip disease	
54	98125	heart
20	98120	flu

Voters V

name	age	zip
p1	54	98125
p2	20	98120

$$P\bowtie_{P.age=V.age}V$$

age	P.zip	disease	name	V.zip
54	98125	heart	p1	98125
20	98120	flu	p2	98120

Join Summary

- Theta-join: $R \bowtie_{\theta} S = \sigma_{\theta}(R \times S)$
 - Join of R and S with a join condition θ
 - Cross-product followed by selection θ
- Equijoin: $R \bowtie_{\theta} S = \pi_A (\sigma_{\theta}(R \times S))$
 - Join condition θ consists only of equalities
 - Projection π_A drops all redundant attributes
- Natural join: $R \bowtie S = \pi_A (\sigma_\theta(R \times S))$
 - Equijoin
 - Equality on all fields with same name in R and in S

More Joins

Outer join

- Include tuples with no matches in the output
- Use NULL values for missing attributes

Variants

- Left outer join
- Right outer join
- Full outer join

Outer Join Example

AnonPatient P

age	zip	disease	
54	98125	heart	
20	98120	flu	
33	98120	lung	

AnnonJob J

job	age	zip
lawyer	54	98125
cashier	20	98120

age	zip	disease	job
54	98125	heart	lawyer
20	98120	flu	cashier
33	98120	lung	null

Some Examples

```
Supplier(sno,sname,scity,sstate)
Part(pno,pname,psize,pcolor)
Supply(sno,pno,qty,price)
```

Q2: Name of supplier of parts with size greater than 10 $\pi_{\text{sname}}(\text{Supplier} \bowtie \text{Supply} (\sigma_{\text{psize}>10} \text{ (Part)})$

Q3: Name of supplier of red parts or parts with size greater than 10 $\pi_{\text{sname}}(\text{Supplier} \bowtie \text{Supply} \bowtie (\sigma_{\text{psize}>10} \ (\text{Part}) \cup \sigma_{\text{pcolor='red'}} \ (\text{Part}) \) \)$

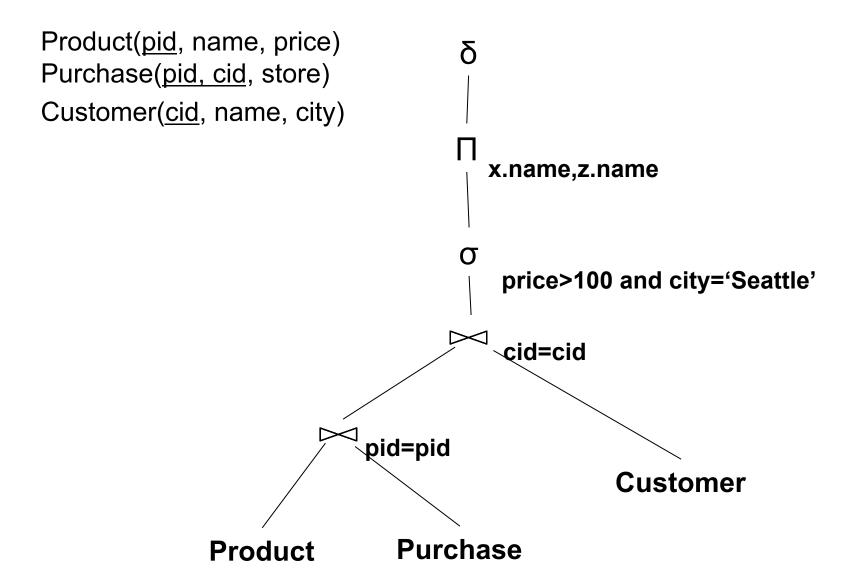

From SQL to RA

From SQL to RA

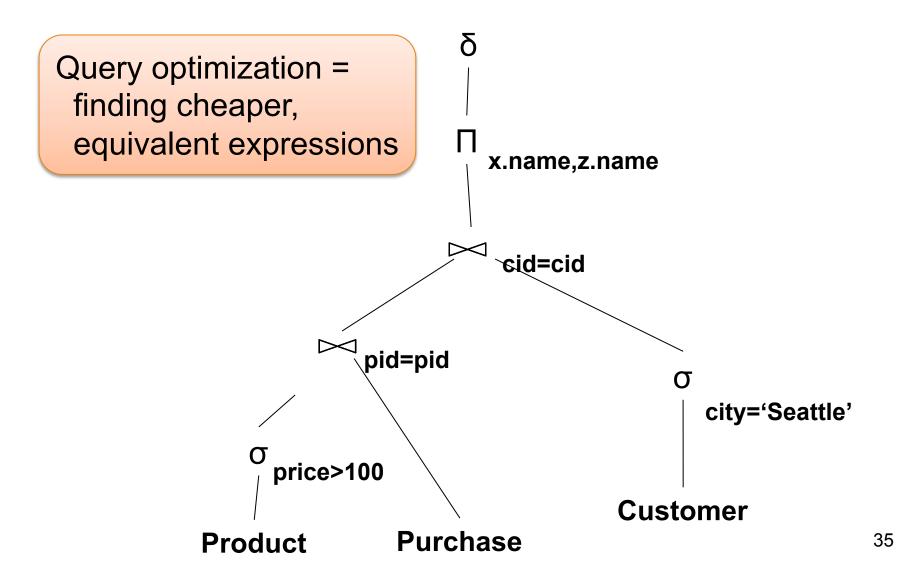

Product(<u>pid</u>, name, price) Purchase(<u>pid</u>, <u>cid</u>, store) Customer(<u>cid</u>, name, city)

SELECT DISTINCT x.name, z.name
FROM Product x, Purchase y, Customer z
WHERE x.pid = y.pid and y.cid = z.cid and
x.price > 100 and z.city = 'Seattle'

From SQL to RA

An Equivalent Expression

Extended RA: Operators on Bags

- Duplicate elimination δ
- Grouping γ
- Sorting τ

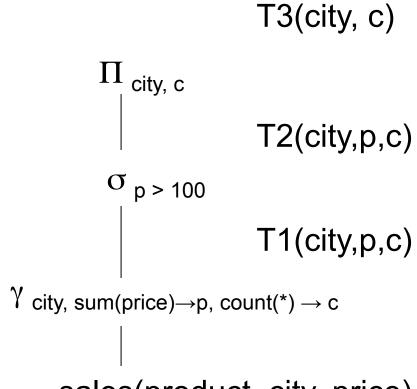

Logical Query Plan

SELECT city, count(*)

FROM sales

GROUP BY city

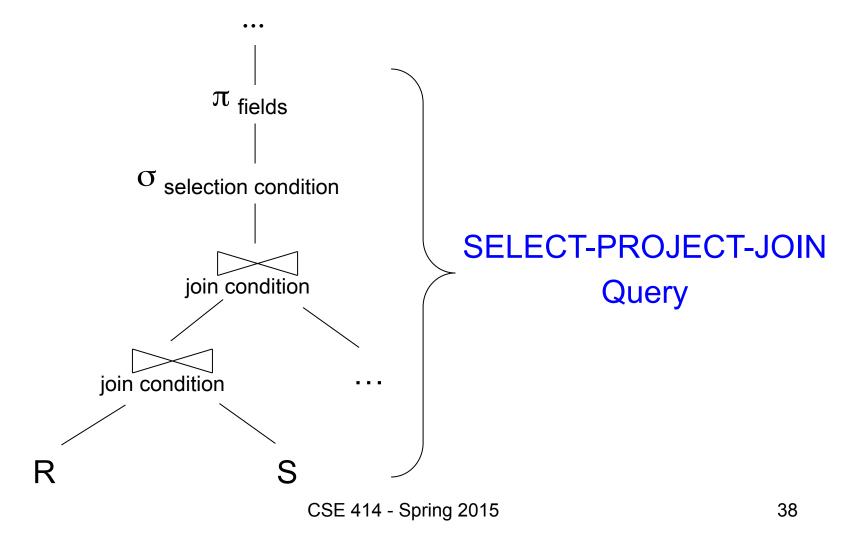

HAVING sum(price) > 100

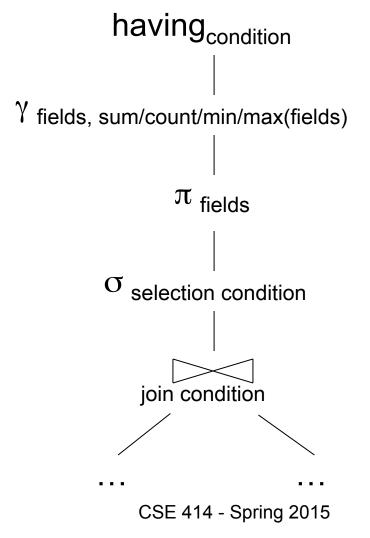

T1, T2, T3 = temporary tables

sales(product, city, price)

Typical Plan for Block (1/2)

Typical Plan For Block (2/2)

How about Subqueries?

```
SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA'
and not exists
(SELECT *
FROM Supply P
WHERE P.sno = Q.sno
and P.price > 100)
```

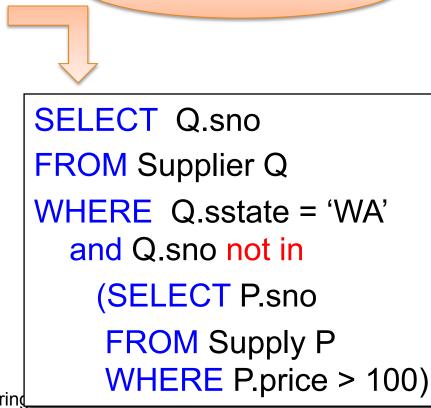

How about Subqueries?

```
SELECT Q.sno
FROM Supplier Q 
WHERE Q.sstate = 'WA'
and not exists
(SELECT *
FROM Supply P
WHERE P.sno = Q.sno
and P.price > 100)
```

De-Correlation

How about Subqueries?

```
SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA'
and not exists
(SELECT *
FROM Supply P
WHERE P.sno = Q.sno
and P.price > 100)
```

CSE 414 - Spring

How about Subqueries?

Un-nesting

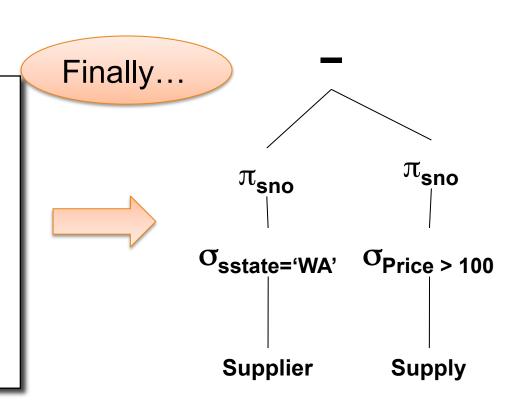

(SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA')
EXCEPT
(SELECT P.sno
FROM Supply P
WHERE P.price > 100)

EXCEPT = set difference

SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA'
and Q.sno not in
(SELECT P.sno
FROM Supply P
WHERE P.price > 100)

How about Subqueries?

(SELECT Q.sno
FROM Supplier Q
WHERE Q.sstate = 'WA')
EXCEPT
(SELECT P.sno
FROM Supply P
WHERE P.price > 100)

From Logical Plans to Physical Plans

Example

```
SELECT sname
FROM Supplier x, Supply y
WHERE x.sid = y.sid
and y.pno = 2
and x.scity = 'Seattle'
and x.sstate = 'WA'
```

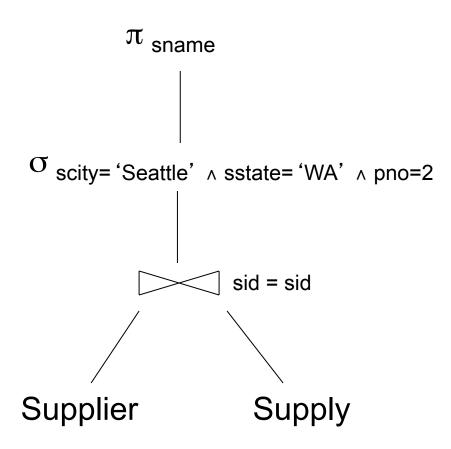

Give a relational algebra expression for this query

Relational Algebra

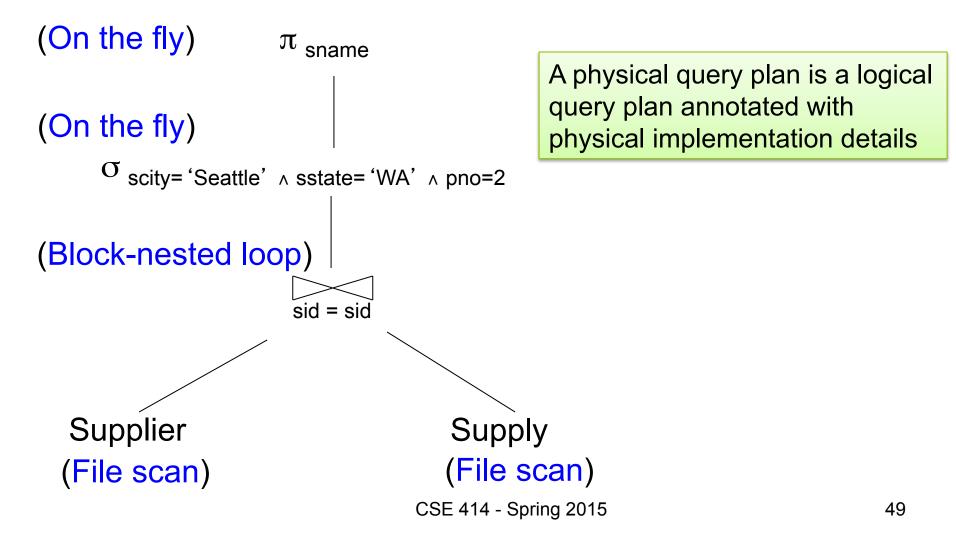

$$\pi_{\text{sname}}(\sigma_{\text{scity= 'Seattle' } \land \text{ sstate= 'WA' } \land \text{ pno=2}}(\text{Supplier}))$$

Relational Algebra

Relational algebra expression is also called the "logical query plan"

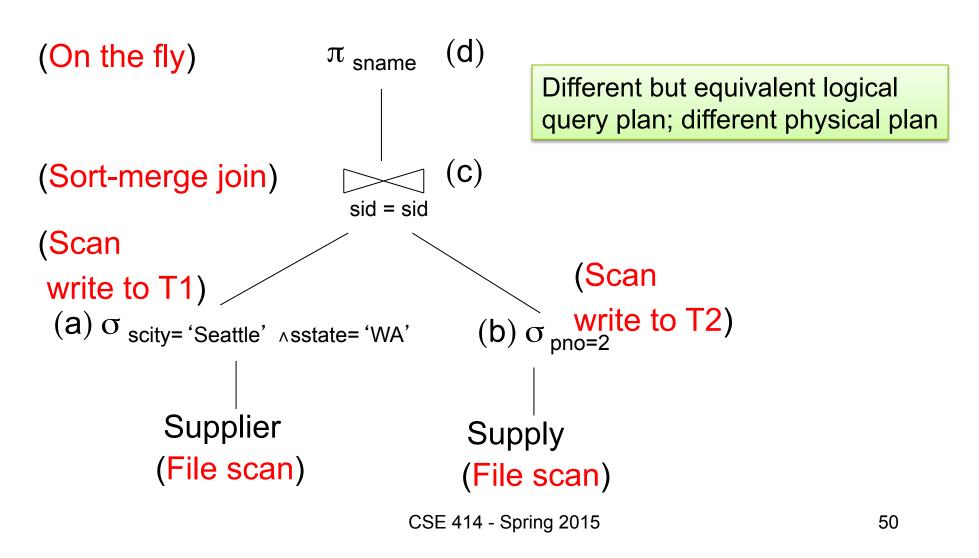

Physical Query Plan 1

Supplier(sid, sname, scity, sstate)

Supply(sid, pno, quantity)

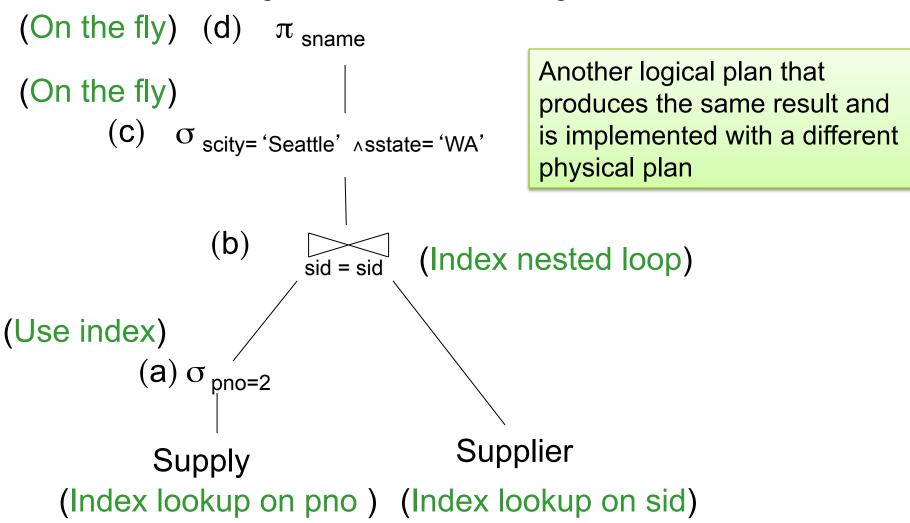

Physical Query Plan 2

Supplier(sid, sname, scity, sstate)

Supply(sid, pno, quantity)

Physical Query Plan 3

Assume: clustered Doesn't matter if clustered or not

Physical Data Independence

- Means that applications are insulated from changes in physical storage details
 - E.g., can add/remove indexes without changing apps
 - Can do other physical tunings for performance
- SQL and relational algebra facilitate physical data independence because both languages are "set-at-a-time": Relations as input and output
