# Introduction to Database Systems CSE 414

Lecture 19: Views

#### **Announcements**

 New web quiz and homework out now. Due Monday and Wednesday next week.

Today: Views

#### Views

- A view in SQL =
  - A table computed from other tables, s.t., whenever the base tables are updated, the view is updated too
- More generally:
  - A view is derived data that keeps track of changes in the original data
- Compare:
  - A function computes a value from other values, but does not keep track of changes to the inputs

### A Simple View

Create a view that returns for each store the prices of products purchased at that store

CREATE VIEW StorePrice AS
SELECT DISTINCT x.store, y.price
FROM Purchase x, Product y
WHERE x.product = y.pname

This is like a new table StorePrice(store,price)

### We Use a View Like Any Table

- A "high end" store is a store that sell some products over 1000.
- For each customer, return all the high end stores that they visit.

```
SELECT DISTINCT u.customer, u.store
FROM Purchase u, StorePrice v
WHERE u.store = v.store
AND v.price > 1000
```

### Types of Views

- Virtual views
  - Used in databases
  - Computed only on-demand slow at runtime
  - Always up to date
- Materialized views
  - Used in data warehouses
  - Pre-computed offline fast at runtime
  - May have stale data (must recompute or update)
  - Indexes are materialized views
- A key component of physical tuning of databases is the selection of materialized views and indexes

### **Query Modification**

For each customer, find all the high end stores that they visit.

CREATE VIEW StorePrice AS
SELECT DISTINCT x.store, y.price
FROM Purchase x, Product y
WHERE x.product = y.pname

SELECT DISTINCT u.customer, u.store FROM Purchase u, StorePrice v WHERE u.store = v.store AND v.price > 1000

### **Query Modification**

For each customer, find all the high end stores that they visit.

CREATE VIEW StorePrice AS
SELECT DISTINCT x.store, y.price
FROM Purchase x, Product y
WHERE x.product = y.pname

SELECT DISTINCT u.customer, u.store

FROM Purchase u, StorePrice v WHERE u.store = v.store AND v.price > 1000

#### Modified query:

```
SELECT DISTINCT u.customer, u.store
FROM Purchase u,
(SELECT DISTINCT x.store, y.price
FROM Purchase x, Product y
WHERE x.product = y.pname) v
WHERE u.store = v.store
AND v.price > 1000
```

### **Query Modification**

For each customer, find all the high end stores that they visit.

SELECT DISTINCT u.customer, u.store FROM Purchase u, Purchase x, Product y WHERE u.store = x.store AND y.price > 1000 AND x.product = y.pname Notice that Purchase occurs twice. Why?

#### Modified query:

#### Modified and unnested query:

```
SELECT DISTINCT u.customer, u.store
FROM Purchase u,
(SELECT DISTINCT x.store, y.price
FROM Purchase x, Product y
WHERE x.product = y.pname) v
WHERE u.store = v.store
AND v.price > 1000
```

Retrieve all stores whose name contains ACME

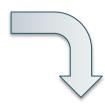

CREATE VIEW StorePrice AS
SELECT DISTINCT x.store, y.price
FROM Purchase x, Product y
WHERE x.product = y.pname

SELECT DISTINCT v.store FROM StorePrice v WHERE v.store like '%ACME%'

Retrieve all stores whose name contains ACME

CREATE VIEW StorePrice AS
SELECT DISTINCT x.store, y.price
FROM Purchase x, Product y
WHERE x.product = y.pname

SELECT DISTINCT v.store FROM StorePrice v WHERE v.store like '%ACME%'

#### Modified query:

```
SELECT DISTINCT v.store
FROM
(SELECT DISTINCT x.store, y.price
FROM Purchase x, Product y
WHERE x.product = y.pname) v
WHERE v.store like '%ACME%'
```

Retrieve all stores whose name contains ACME

SELECT DISTINCT x.store
FROM Purchase x, Product y
WHERE x.product = y.pname
AND x.store like '%ACME%'

We can further optimize! How?

#### Modified query:

Modified and unnested query:

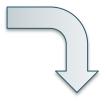

```
SELECT DISTINCT v.store
FROM
(SELECT DISTINCT x.store, y.price
FROM Purchase x, Product y
WHERE x.product = y.pname) v
WHERE v.store like '%ACME%'
```

Retrieve all stores whose name contains ACME

SELECT DISTINCT x.store
FROM Purchase x, Product y
WHERE x.product = y.pname
—AND—x.store like '%ACME%'

Assuming Product.pname is a key <u>and</u> Purchase.product is a foreign key

Modified and unnested query:

**Final Query** 

SELECT DISTINCT x.store FROM Purchase x WHERE x.store like '%ACME%'

### **Applications of Virtual Views**

- Increased physical data independence. e.g.
  - Vertical data partitioning
  - Horizontal data partitioning
- Logical data independence. e.g.
  - Change schemas of base relations (i.e., stored tables)
- Security
  - View reveals only what the users are allowed to know

### **Vertical Partitioning**

#### Resumes

•	<u>SSN</u>	Name	Address	Resume	Picture
	234234	Mary	Huston	Clob1	Blob1
	345345	Sue	Seattle	Clob2	Blob2
	345343	Joan	Seattle	Clob3	Blob3
	432432	Ann	Portland	Clob4	Blob4

**T1** 

<u>SSN</u>	Name	Address
234234	Mary	Huston
345345	Sue	Seattle

**T2** -

<u>SSN</u>	Resume
234234	Clob1
345345	Clob2

**T3** 

<u>SSN</u>	Picture
234234	Blob1
345345	Blob2

T2.SSN is a key and a foreign key to T1.SSN. Same for T3.SSN

T1(<u>ssn</u>,name,address) T2(<u>ssn</u>,resume)

Resumes(<u>ssn</u>,name,address,resume,picture)

T3(ssn,picture)

### **Vertical Partitioning**

```
CREATE VIEW Resumes AS
```

SELECT T1.ssn, T1.name, T1.address,

T2.resume, T3.picture

**FROM** T1,T2,T3

WHERE T1.ssn=T2.ssn AND T1.ssn=T3.ssn

T1(<u>ssn</u>,name,address)
T2(<u>ssn</u>,resume)
T3(<u>ssn</u>,picture)

Resumes(<u>ssn</u>,name,address,resume,picture)

### **Vertical Partitioning**

```
CREATE VIEW Resumes AS
SELECT T1.ssn, T1.name, T1.address,
T2.resume, T3.picture
FROM T1,T2,T3
WHERE T1.ssn=T2.ssn AND T1.ssn=T3.ssn
```

```
SELECT address
FROM Resumes
WHERE name = 'Sue'
```

T1(<u>ssn</u>,name,address) T2(<u>ssn</u>,resume)

Resumes(<u>ssn</u>,name,address,resume,picture)

T3(ssn,picture)

### **Vertical Partitioning**

**CREATE VIEW Resumes AS** 

SELECT T1.ssn, T1.name, T1.address,

T2.resume, T3.picture

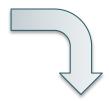

**FROM** T1,T2,T3

WHERE T1.ssn=T2.ssn AND T1.ssn=T3.ssn

**SELECT** address

FROM Resumes

WHERE name = 'Sue'

#### Modified query:

**SELECT T1.address** 

**FROM** T1, T2, T3

WHERE T1.name = 'Sue'

AND T1.SSN=T2.SSN

AND T1.SSN = T3.SSN

T1(<u>ssn</u>,name,address) T2(<u>ssn</u>,resume)

Resumes(<u>ssn</u>,name,address,resume,picture)

T3(ssn,picture)

### **Vertical Partitioning**

**CREATE VIEW Resumes AS** 

SELECT T1.ssn, T1.name, T1.address,

T2.resume, T3.picture

**FROM** T1,T2,T3

WHERE T1.ssn=T2.ssn AND T1.ssn=T3.ssn

**SELECT** address

FROM Resumes

WHERE name = 'Sue'

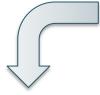

#### Final query:

SELECT T1.address FROM T1 WHERE T1.name = 'Sue'

#### Modified query:

SELECT T1.address
FROM T1, T2, T3
WHERE T1.name = 'Sue'
AND T1.SSN=T2.SSN
AND T1.SSN = T3.SSN

## Vertical Partitioning Applications

#### 1. Advantages

- Speeds up queries that touch only a small fraction of columns
- Single column can be compressed effectively, reducing disk I/O

#### 2. Disadvantages

- Updates are expensive!
- Need many joins to access many columns
- Repeated key columns add overhead

Hot trend today for data analytics: e.g., Vertica startup acquired by HP They use a highly-tuned column-oriented data store AND engine

# Horizontal Partitioning

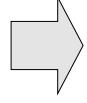

#### **Customers**

SSN	Name	City
234234	Mary	Houston
345345	Sue	Seattle
345343	Joan	Seattle
234234	Ann	Portland
	Frank	Calgary
	Jean	Montreal

#### CustomersInHouston

	149	
234234 Mary	Houston	

#### **CustomersInSeattle**

SSN	Name	City
345345	Sue	Seattle
345343	Joan	Seattle

. . . . .

Customers(<u>ssn</u>,name,city)

. . . . .

#### Horizontal Partitioning

CREATE VIEW Customers AS
CustomersInHouston
UNION ALL
CustomersInSeattle
UNION ALL

Customers(<u>ssn</u>,name,city)

. . . . .

### Horizontal Partitioning

```
SELECT name
FROM Customers
WHERE city = 'Seattle'
```

Which tables are inspected by the system?

Customers(<u>ssn</u>,name,city)

. . . .

### Horizontal Partitioning

```
SELECT name
FROM Customers
WHERE city = 'Seattle'
```

Which tables are inspected by the system?

All tables!

The systems doesn't know that CustomersInSeattle.city = 'Seattle'

Customers(<u>ssn</u>,name,city)

. . . . .

### Horizontal Partitioning

Better: remove CustomerInHuston.city etc

```
CREATE VIEW Customers AS

(SELECT SSN, name, 'Houston' as city
FROM CustomersInHouston)

UNION ALL

(SELECT SSN, name, 'Seattle' as city
FROM CustomersInSeattle)

UNION ALL
```

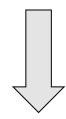

. . .

Customers(<u>ssn</u>,name,city)

. . . . .

#### Horizontal Partitioning

SELECT name
FROM Customers
WHERE city = 'Seattle'

SELECT name FROM CustomersInSeattle

### Horizontal Partitioning Applications

- Performance optimization
  - Especially for data warehousing
  - E.g. one partition per month
  - E.g. archived applications and active applications
- Distributed and parallel databases
- Data integration
