## Database Systems CSE 414

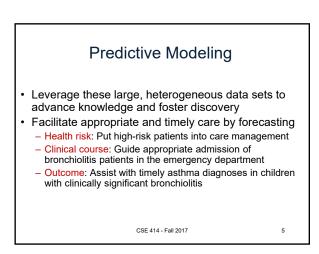

Lecture 28: Database Techniques for Machine Learning - Automating Machine Learning Model Building with Clinical Big Data

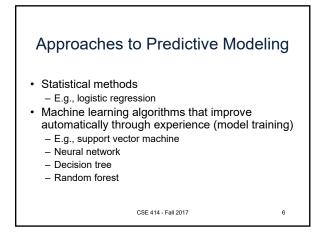

CSE 414 - Fall 2017

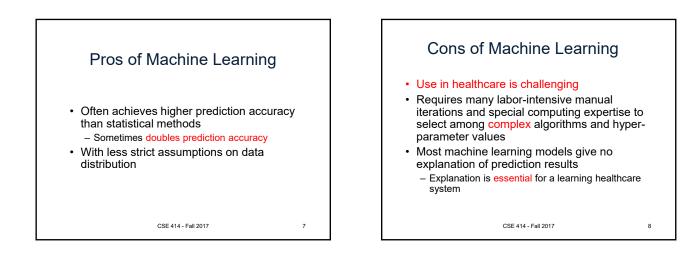

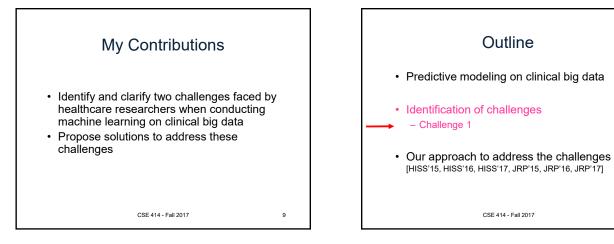

Clinical Big Data (Large Clinical Data Sets) Outline · Volume of healthcare data • Predictive modeling on clinical big data - Increase 50-fold in 8 years to 25,000 petabytes by 2020 · Diverse sources · Identification of challenges - Electronic medical records Sensors • Our approach to address the challenges - Mobile devices [HISS'15, HISS'16, HISS'17, JRP'15, JRP'16, JRP'17] · Opportunities to advance clinical care and biomedical research CSE 414 - Fall 2017 3 CSE 414 - Fall 2017

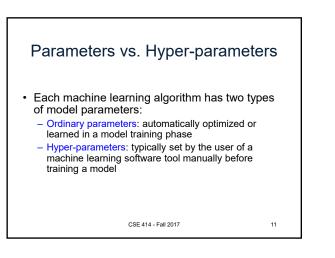

1

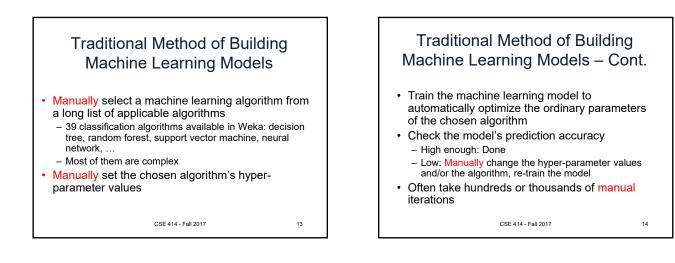

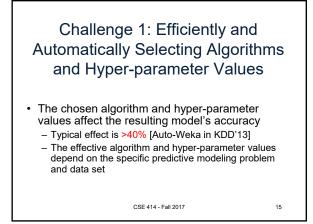

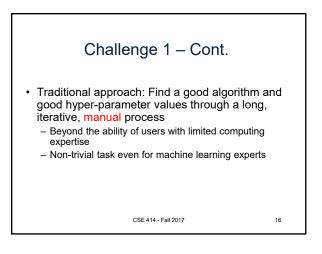

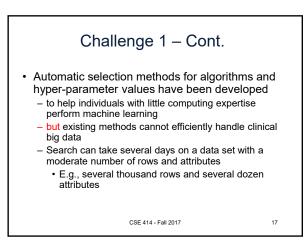

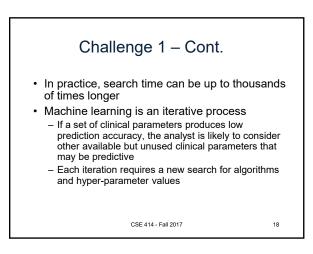

Parameters vs. Hyper-parameters – Cont.		
Machine learning algorithm	Example ordinary parameters	Example hyper- parameters
Random forest	the input variable used and threshold value chosen at each internal node of a decision tree	# of decision trees, # of input variables to consider at each internal node of a decision tree
Support vector machine	the support vectors, the Lagrange multiplier for each support vector	the kernel to use, the degree of a polynomial kernel
Neural network	the weight on each edge	# of hidden layers, # of nodes on each hidden layer

26

Existing Big Data Software Systems

· Job execution usually requires repeated reading

and writing of data from and to disk, incurring

- Executes most operations in memory and avoids disk

CSE 414 - Fall 2017

· Hadoop implements Google's MapReduce

· Spark overcomes Hadoop's shortcomings

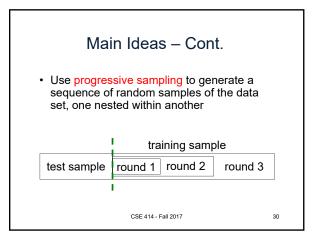

· MLlib is Spark's machine learning library

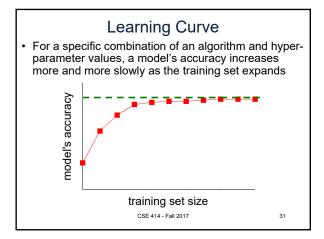

framework for distributed computing - Unsuitable for iterative and interactive jobs

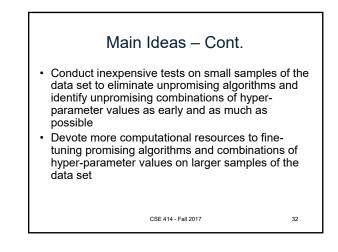

significant overhead

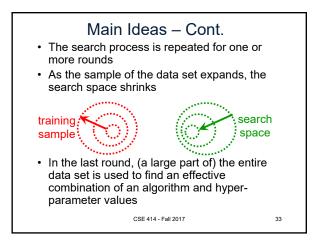

inputs/outputs when possible

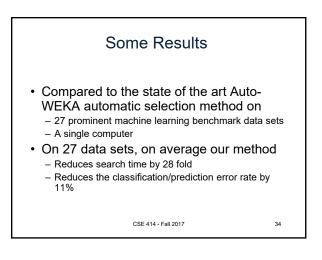

Improves performance

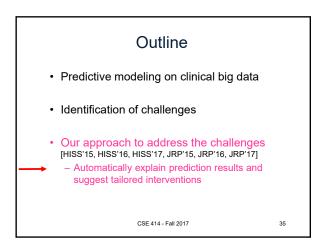

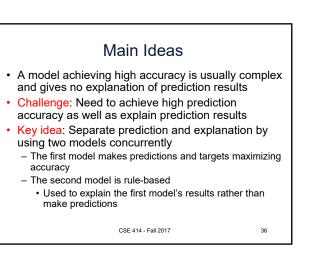

## Main Ideas – Cont.

- The rules used in the second model are mined directly from historical data
- Use one or more rules to explain the prediction result for a patient
- · Suggest tailored interventions based on the reasons listed in the rules

CSE 414 - Fall 2017

## Some Results

- Test case: Predicting type 2 diabetes diagnosis within the next year
- Electronic medical record data of 10K patients
- Can explain prediction results for 87% of patients who were correctly predicted by a champion machine learning model to have type 2 diabetes diagnosis within the next year

CSE 414 - Fall 2017

38

## **Example Rule**

- · The patient had prescriptions of angiotensinconverting-enzyme (ACE) inhibitor in the past three years AND the patient's maximum body mass index recorded in the past three years is  $\geq$ 35  $\rightarrow$  the patient will have type 2 diabetes diagnosis within the next year
  - ACE inhibitor is used mainly for treating hypertension and congestive heart failure
  - Obesity, hypertension, and congestive heart failure are known to correlate with type 2 diabetes
- · Example intervention: Enroll the patient in a weight loss program CSE 414 - Fall 2017
