#### Database Systems CSE 414

#### Lectures 5: Grouping & Aggregation

#### Announcements

- HW2 is out
  - due next Tuesday 11pm
  - same format as HW1
  - uses joins, aggregation, grouping
- WQ2 due Sunday 11pm

### Outline

- Last time:
  - outer joins
  - how to aggregate over all rows
- Grouping & aggregations (6.4.3 6.4.6)

# Aggregation

Purchase(product, price, quantity)

Find number of bagels sold for more than \$1

SELECT	Sum(quantity) as TotalSold
FROM	Purchase
WHERE	<pre>price &gt; 1 and product = 'bagel'</pre>

# **Grouping and Aggregation**

Purchase(product, price, quantity)

Find number sold for more than \$1 for each product

SELECT	product, Sum(quantity)
FROM	Purchase
WHERE	price > 1
<b>GROUP BY</b>	product

Let's see what this means...

CSE 414 - Spring 2017

# **Grouping and Aggregation**

- 1. Compute the FROM and WHERE clauses.
- 2. Group by the attributes in the GROUP BY
- 3. Compute the SELECT clause: grouped attributes and aggregates.

#### 1&2. FROM-WHERE-GROUPBY

# 3. SELECT

Product	Price	Quantity		
Bagel	3	20	Product	sum(quantity)
Bagel	1.50	20	Bagel	40
Banana	0.5	50	Banana	20
Banana	2	10		
Banana	4	10		

SELECT	product, Sum(quantity)
FROM	Purchase
WHERE	price > 1
GROUP BY	product

CSE 414 - Spring 2017

#### Need to be Careful...

SELECT product, max(quantity) FROM Purchase GROUP BY product		Product	Price	Quantity
		Bagel	3	20
		Bagel	1.50	20
SELECT product, quantity FROM Purchase		Banana	0.5	50
GROUP BY product		Banana	2	10
		Banana	4	10
sqlite is WRONG on this query.	Be	tter DBMS ( gives a	e.g. SQL Sei an error	rver)
CSE 414	1 - Spr	ing 2017		10

# **Ordering Results**

SELECT product, sum(price\*quantity) FROM Purchase GROUP BY product ORDER BY sum(price\*quantity) DESC

# FWGOS

# **Ordering Results**

SELECT product, sum(price\*quantity) as rev FROM Purchase GROUP BY product ORDER BY rev desc

FWGOS

Note: some SQL engines want you to say ORDER BY sum(price\*quantity)

### HAVING Clause

Same query as earlier, except that we consider only products that had at least 30 sales.

SELECT	product, sum(price*quantity)
FROM	Purchase
WHERE	price > 1
GROUP BY	<pre>/ product</pre>
HAVING	sum(quantity) > 30

HAVING clause contains conditions on groups.

CSE 414 - Spring 2016

#### Exercise

Compute the total income per month Show only months with less than 10 items sold Order by quantity sold and display as "TotalSold"

SELECT	month, sum(price*quantity), sum(quantity) as TotalSold
FROM	Purchase
<b>GROUP BY</b>	month
HAVING	sum(quantity) < 10
ORDER BY	sum(quantity)

FWGHOS

#### WHERE vs HAVING

- WHERE condition is applied to individual rows
  - The rows may or may not contribute to the aggregate
  - No aggregates allowed here
- HAVING condition is applied to the entire group
  - Entire group is returned, or not at all
  - May use aggregate functions in the group

```
Mystery Query
```

What do they compute?

SELECT	month, sum(quantity), max(price)
FROM	Purchase
GROUP BY	month

SELECTmonth, sum(quantity)FROMPurchaseGROUP BYmonth

SELECT

month

FROM Purchase

**GROUP BY** month

Lesson: DISTINCT is a special case of GROUP BY

16

### Aggregates and Joins

```
create table Product(
   pid int primary key,
   pname varchar(15),
   manufacturer varchar(15));
```

```
insert into product values(1, 'bagel', 'Sunshine Co.');
insert into product values(2, 'banana', 'BusyHands');
insert into product values(3, 'gizmo', 'GizmoWorks');
insert into product values(4, 'gadget', 'BusyHands');
insert into product values(5, 'powerGizmo', 'PowerWorks');
```

# Aggregate + Join Example

SELECT manufacturer, count(\*) FROM Product, Purchase WHERE pname = product GROUP BY manufacturer Let's figure out what these

mean...

SELECT manufacturer, month, count(\*) FROM Product, Purchase WHERE pname = product GROUP BY manufacturer, month

#### Nested Loop Semantics for SFW

SELECT x1.a1, x2.a2, ... xm.amFROMR1 as x1, R2 as x2, ... Rm as xmWHERECond

for x1 in R1: for x2 in R2:

. . .

Nested loop semantics

for xm in Rm:
 if Cond(x1, x2...):
 output(x1.a1, x2.a2, ... xm.am)

CSE 414 - Spring 2016

#### Semantics for SFWGH

S = may contain attributes a<sub>1</sub>,...,a<sub>k</sub> and/or any aggregates but NO OTHER ATTRIBUTES
C1 = is any condition on the attributes in R<sub>1</sub>,...,R<sub>n</sub>
C2 = is any condition on aggregate expressions and on attributes a<sub>1</sub>,...,a<sub>k</sub>

CSE 414 - Spring 2016

Why?

### Semantics for SFWGH

Evaluation steps:

- 1. Evaluate FROM-WHERE using Nested Loop Semantics
- 2. Group by the attributes  $a_1, \ldots, a_k$
- 3. Apply condition C2 to each group (may have aggregates)
- 4. Compute aggregates in S and return the result

### Semantics for SFWGH

Execution order:

FWGHOS

Evaluation steps:

- 1. Evaluate FROM-WHERE using Nested Loop Semantics
- 2. Group by the attributes  $a_1, \ldots, a_k$
- 3. Apply condition C2 to each group (may have aggregates)
- 4. Compute aggregates in S and return the result

# Aggregate + Join Example

SELECT manufacturer, count(\*) FROM Product, Purchase WHERE pname = product GROUP BY manufacturer

SELECT manufacturer, month, count(\*) FROM Product, Purchase WHERE pname = product GROUP BY manufacturer, month

# **Empty Groups**

- In the result of a group by query, there is one row per group in the result
- No group can be empty!
- In particular, count(\*) is never 0

SELECT manufacturer, count(\*) FROM Product, Purchase WHERE pname = product GROUP BY manufacturer What if there are no purchases for a manufacturer

### Empty Group Solution: Outer Join

SELECT manufacturer, count(quantity) FROM Product LEFT OUTER JOIN Purchase ON pname = product GROUP BY manufacturer

CSE 414 - Spring 2016

#### Exercise:

Find all manufacturers with more than 10 items sold. Return manufacturer name and number of items sold.

SELECT manufacturer, sum(quantity) FROM Product, Purchase WHERE pname = product GROUP BY manufacturer HAVING sum(quantity) > 10

#### Exercise:

Find all manufacturers with more than 1 distinct product sold Return the name of the manufacturer and number of distinct products sold

SELECT manufacturer, count(distinct product) FROM Product, Purchase WHERE pname = product GROUP BY manufacturer HAVING count(distinct product) > 1

#### Exercise:

Find all products with more than 2 purchases Return the name of the product and max price it was sold

SELECT pname max(price) FROM Product, Purchase WHERE pname = product GROUP BY pname HAVING COUNT(\*) > 2

#### Exercise:

Find all manufacturers with at least 5 purchases in one month Return manufacturer name, month, and number of items sold

SELECT manufacturer, month, sum(quantity) FROM Product, Purchase GROUP BY manufacturer, month HAVING count(\*) > 2
