

Solving Problems by Searching

Terminology

- State
- State Space
- Goal
- Action
- Cost
- State Change Function
- Problem-Solving Agent
- State-Space Search

Formal State-Space Model

Problem = (S, s, A, f, g, c)

S = state space

s = initial state

A = actions

f = state change function

$f: S \times A \rightarrow S$

g = goal test function

$g: S \rightarrow \{\text{true}, \text{false}\}$

c = cost function

$c: S \times A \times S \rightarrow R$

- How do we define a solution?
- How about an optimal solution?

3 Coins Problem

A Very Small State Space Problem

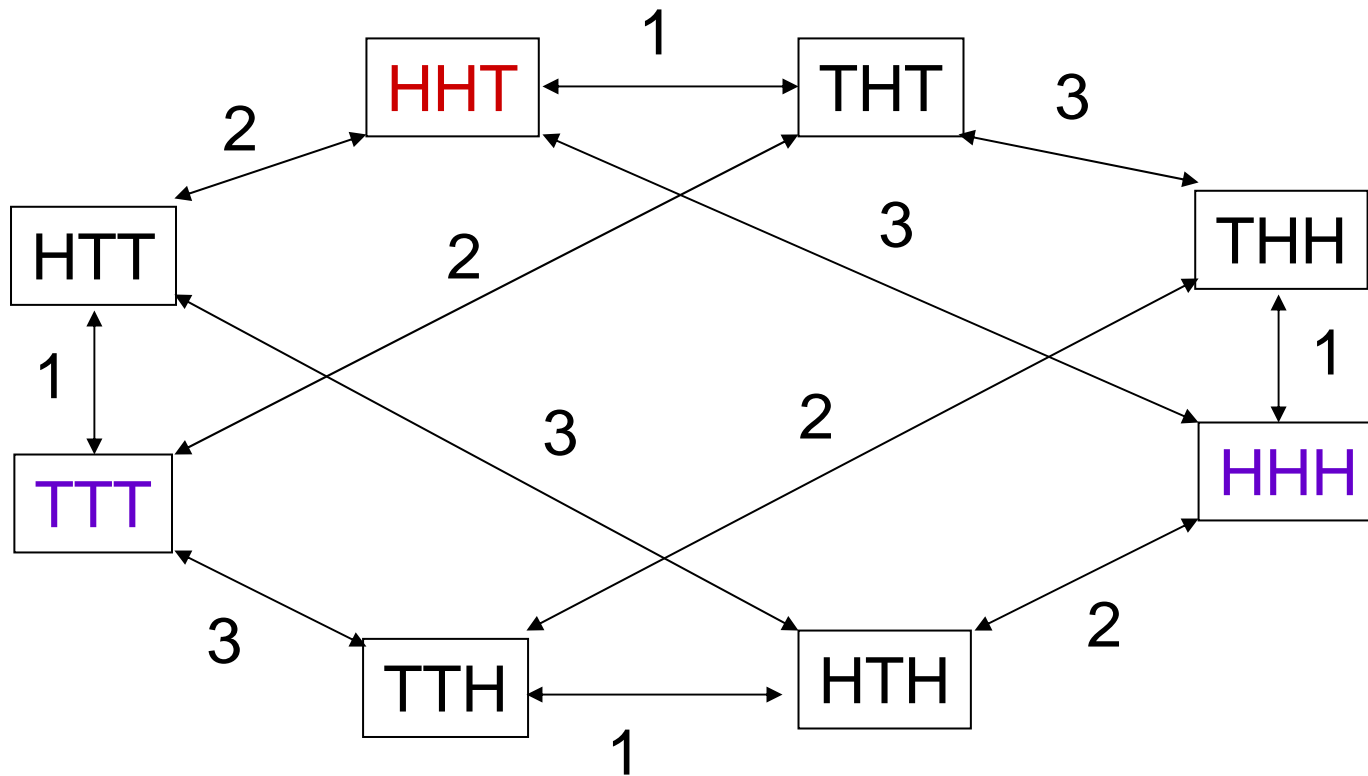

- There are 3 (distinct) coins: coin1, coin2, coin3.
- The initial state is

H	H	T
---	---	---
- The legal operations are to turn over exactly one coin.
 - 1 (flip coin1), 2 (flip coin2), 3 (flip coin3)
- There are two goal states:

H	H	H
T	T	T

What are **S**, **s**, **A**, **f**, **g**, **c** ?

State-Space Graph

- What are some solutions?
- What if the problem is changed to allow only 3 actions?

Modified State-Space Problem

- How would you define a state for the new problem?
- How do you define the operations (1, 2, 3) with this new state definition?
- What do the paths to the goal states look like now?

How do we build a search tree for the modified 3 coins problem?

The 8-Puzzle Problem

one
initial
state

7	2	4
5	B	6
8	3	1

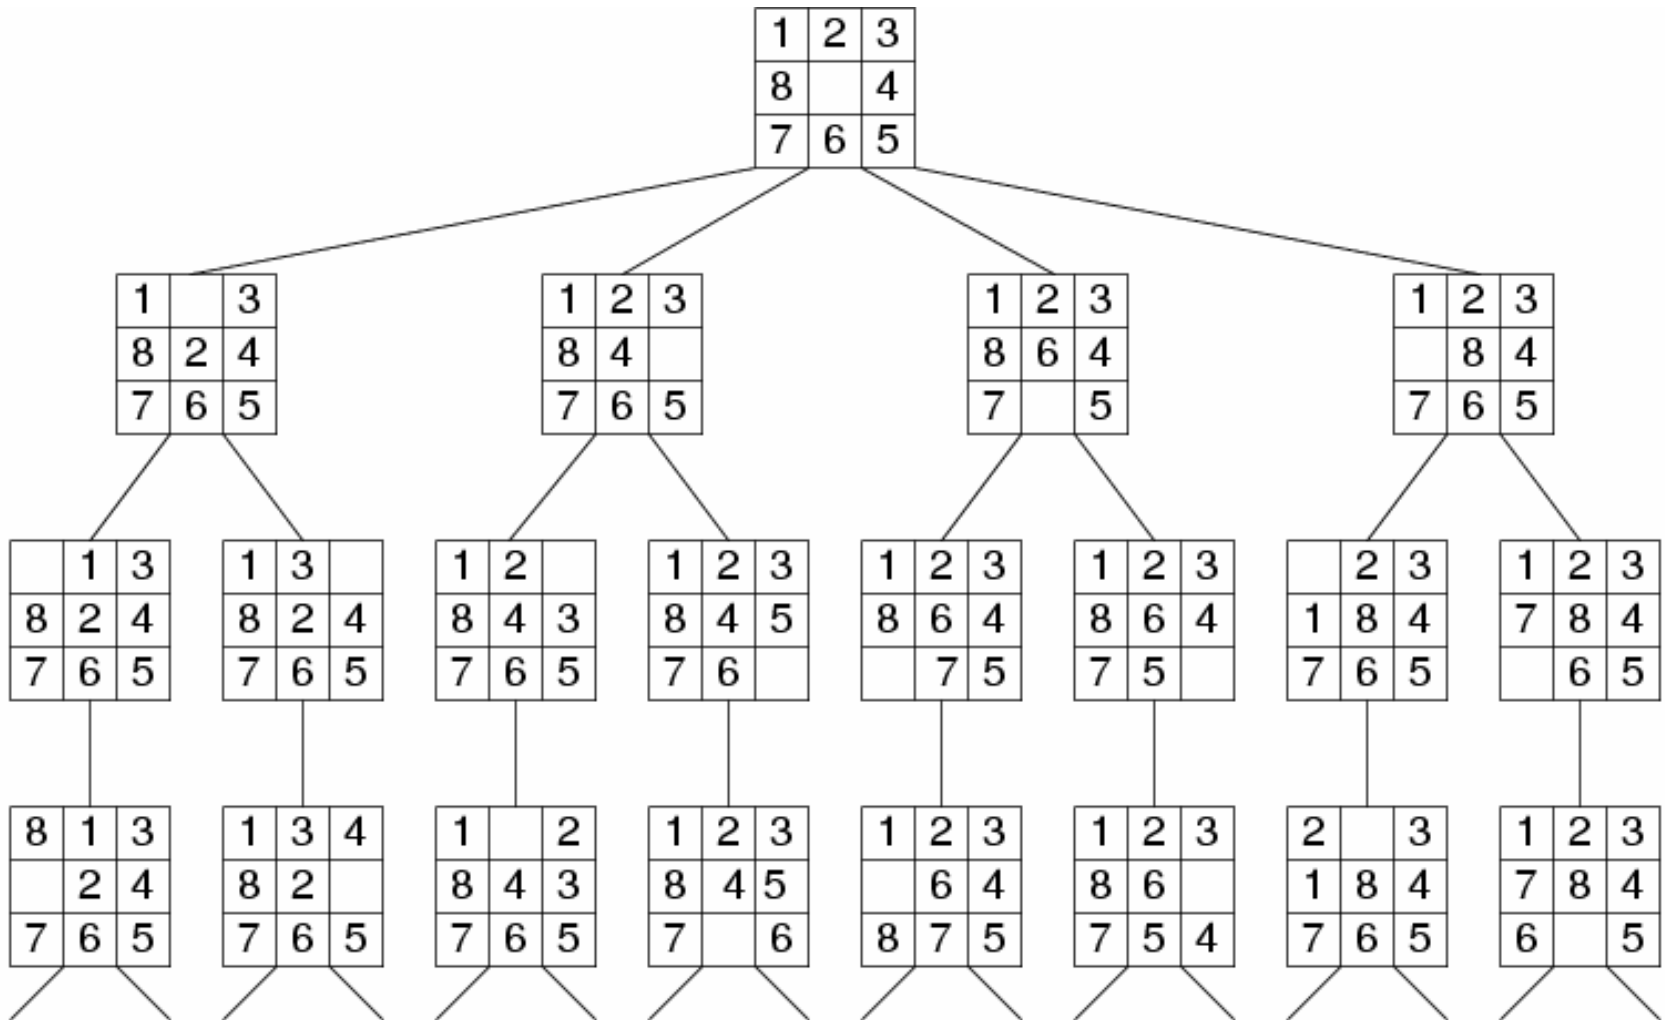

goal
state

B	1	2
3	4	5
6	7	8

B=blank

1. Formalize a state as a data structure
2. Show how start and goal states are represented.
3. How many possible states are there?
4. How would you specify the state-change function?
5. What is the goal test?
6. What is the path cost function?
7. What is the complexity of the search?

Search Tree Example: Fragment of 8-Puzzle Problem Space

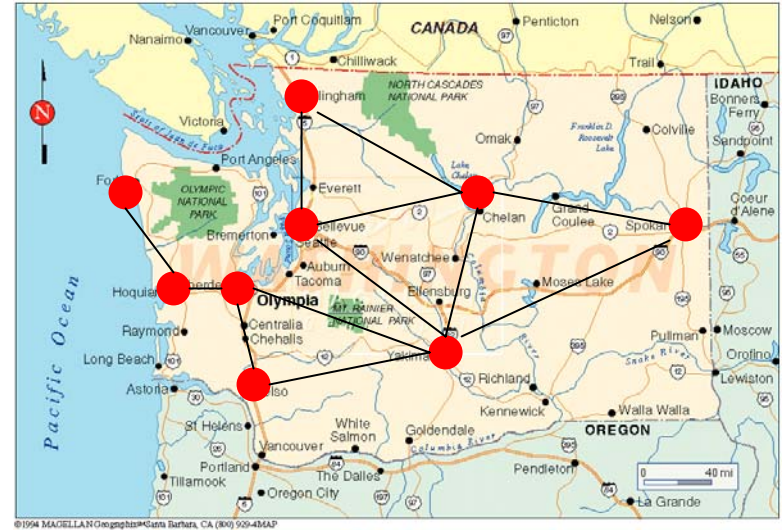

Another Example: N Queens

- Input:
 - Set of states
 - Operators [and costs]
 - Start state
 - Goal state (test)
- Output

		Q	
Q			
			Q
	Q		

Example: Route Planning

- Input:
 - Set of states
 - Operators [and costs]
 - Start state
 - Goal state (test)
- Output:

Search Strategies

- **Blind Search (Ch 3)**
 - Depth first search
 - Breadth first search
 - Depth limited search
 - Iterative deepening search
- **Informed Search (Ch 4)**
- **Constraint Satisfaction (Ch 5)**

Depth First Search

- Maintain stack of nodes to visit
- Evaluation
 - Complete?
Not for infinite spaces
 - Time Complexity?
 $O(b^d)$
 - Space ?
 $O(d)$

Breadth First Search

- Maintain queue of nodes to visit
- Evaluation

– Complete?

Yes

– Time Complexity?

$O(b^d)$

– Space?

$O(b^d)$

The Missionaries and Cannibals Problem

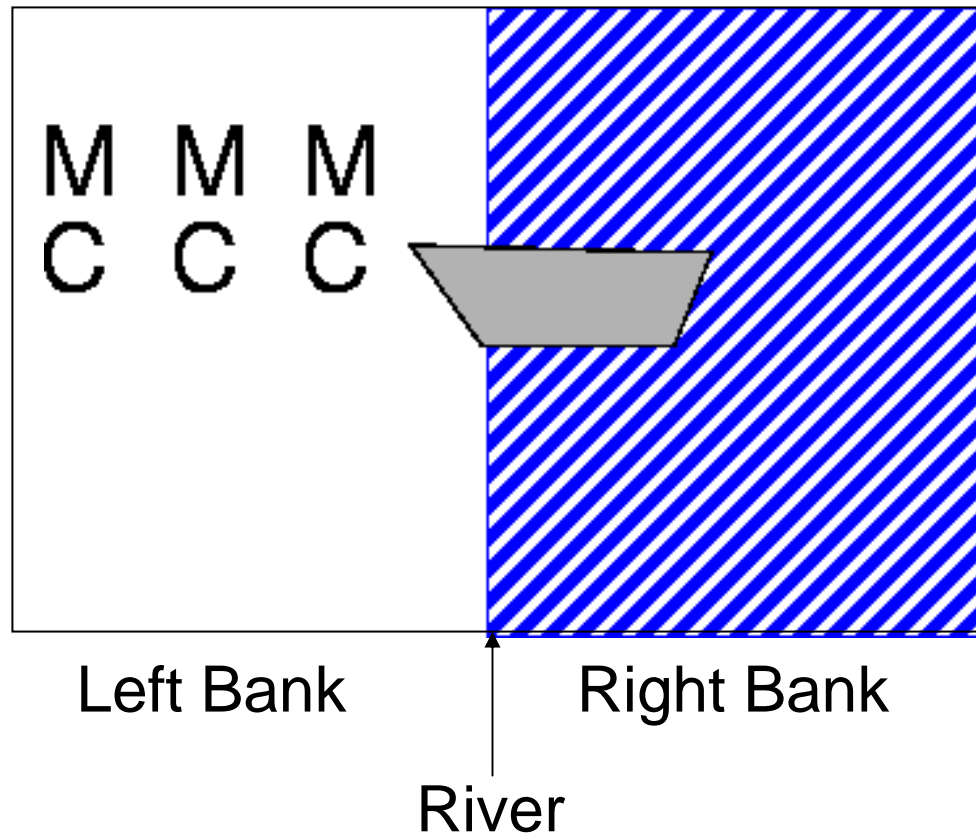

(from text problem 3.9)

- Three missionaries and three cannibals are on one side of a river, along with a boat that can hold one or two people.
- If there are ever more cannibals than missionaries on one side of the river, the cannibals will eat the missionaries. (We call this a “dead” state.)
- Find a way to get everyone to the other side, without anyone getting eaten.

Missionaries and Cannibals Problem

Missionaries and Cannibals Problem

Missionary and Cannibals Notes

- Define your state as (M,C,S)
 - M : number of missionaries on left bank
 - C : number of cannibals on left bank
 - S : side of the river that the boat is on
- When the boat is moving, we are in between states. When it arrives, everyone gets out.

When is a state considered “DEAD”?

1. There are more cannibals than missionaries on the left bank. (Bunga-Bunga)
2. There are more cannibals than missionaries on the right bank. (Bunga-Bunga)
3. There is an ancestor state of this state that is exactly the same as this state. (Why?)

Assignment

- Implement and solve the problem with a **depth-first** search using a stack and/or recursion.
 - Find and print all 4 solutions. (See web page.)
 - Keep track of the total number of states searched.
 - When you get to a dead state, count it and then back up to its parent.
- You may use the computer language of your choice for this assignment.
 - Java
 - C++

Is memory a limitation in search?

- Suppose:
 - 2 GHz CPU
 - 1 GB main memory
 - 100 instructions / expansion
 - 5 bytes / node

- 200,000 expansions / sec
- Memory filled in 100 sec ... < 2 minutes

Iterative Deepening Search

- DFS with limit; incrementally grow limit
- Evaluation

– Complete?

Yes

– Time Complexity?

$O(b^d)$

– Space Complexity?

$O(d)$

Cost of Iterative Deepening

b	ratio ID to DFS
2	3
3	2
5	1.5
10	1.2
25	1.08
100	1.02

Forwards vs. Backwards

vs. Bidirectional

Problem

- All these methods are too slow for real applications (blind)
- Solution → add guidance
- → “informed search”
