Predicting sentiment by topic:
An intelligent restaurant review system

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

It's a big day & I want to book a table at a nice Japanese restaurant

Seattle has many
★★★★
sushi restaurants

What are people
saying about
the food?
the ambiance?...

3

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Positive reviews not positive about everything

Sample review:

Watching the chefs create incredible edible art made the experience very unique.

My wife tried their ramen and it was pretty forgettable.

All the sushi was delicious!
Easily best sushi in Seattle.

Experience

4

STAT/CSE 416: Intro to Machine Learning

From reviews to topic sentiments

All reviews for restaurant

Novel intelligent restaurant review app

Easily best sushi in Seattle.

Intelligent restaurant review system

All reviews for restaurant

Break all reviews into sentences

- The seaweed salad was just OK, vegetable salad was just ordinary.
- I like the interior decoration and the blackboard menu on the wall.
- All the sushi was delicious.
- My wife tried their ramen and it was pretty forgettable.
- The sushi was amazing, and the rice is just outstanding.
- The service is somewhat hectic.
- Easily best sushi in Seattle.

Core building block

Easily best sushi in Seattle.

Sentence Sentiment Classifier

Easily best sushi in Seattle.

Intelligent restaurant review system

All reviews for restaurant

Easily best sushi in Seattle.

Break reviews into sentences about "sushi"

The seaweed salad was just OK, vegetable salad was just ordinary.
 Like the interior decoration and blackboard menu on the wall.
 All the sushi was delicious.
 My wife tried their ramen and it was pretty forgettable.
 The sushi was amazing, and the rice is just outstanding.
 The service is somewhat hectic.

Easily best sushi in Seattle.

Linear classifiers

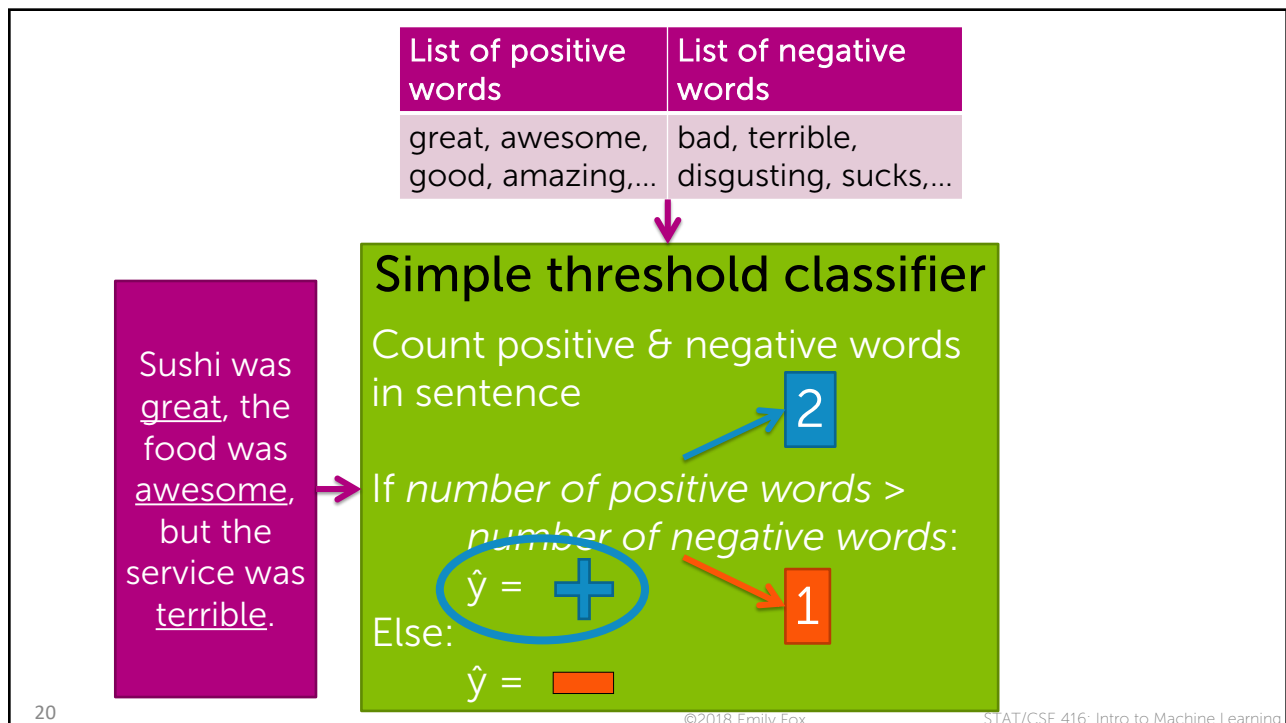

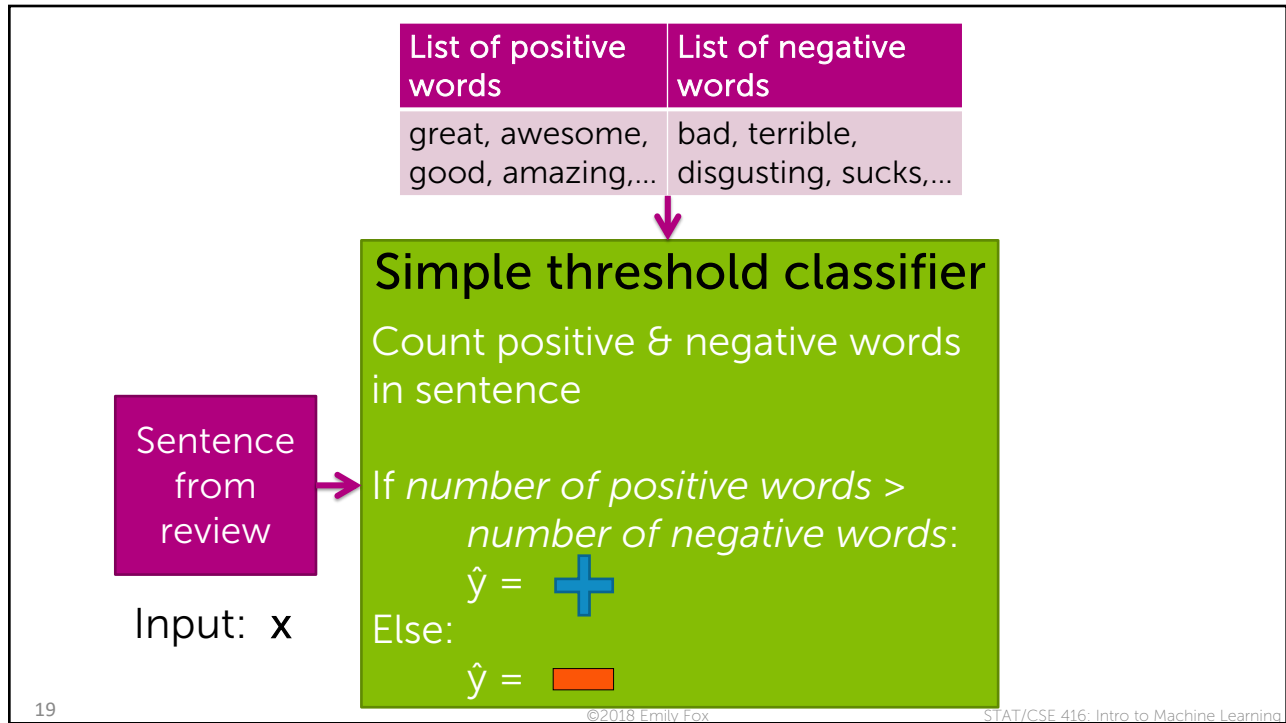

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Representing classifiers

Problems with threshold classifier

- How do we get list of positive/negative words?
- Words have different degrees of sentiment:
 - Great > good
 - How do we weigh different words?
- Single words are not enough:
 - *Good* → Positive
 - *Not good* → Negative

Addressed by
learning a classifier

STAT/CSE 416: Intro to Machine Learning

A (linear) classifier

Will use training data to learn a weight for each word

Word	Weight
good	1.0
great	1.5
awesome	2.7
bad	-1.0
terrible	-2.1
awful	-3.3
restaurant, the, we, where, ...	0.0
...	...

22

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Scoring a sentence

Word	Weight
good	1.0
great	1.2
awesome	1.7
bad	-1.0
terrible	-2.1
awful	-3.3
restaurant, the, we, where, ...	0.0
...	...

Input x_i :

Sushi was great,
the food was awesome,
but the service was terrible.

$$\text{Score}(x_i) = 1.2 \cdot (1) + 1.7 \cdot (1) - 2.1 \cdot (1)$$

count of "great"

$$= 0.8 > 0$$

$$\Rightarrow \hat{y}_i = +1$$

positive review

Called a linear classifier, because output is weighted sum of input.

23

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Word	Weight
...	...

Simple linear classifier

$\text{Score}(x) =$ weighted count of words in sentence

If $\text{Score}(x) > 0$:

$$\hat{y} = \text{+}$$

Else:

$$\hat{y} = \text{-}$$

Sentence from review

Input: x

24

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

More generically...

Model: $\hat{y}_i = \text{sign}(\text{Score}(\mathbf{x}_i))$

$$\begin{aligned} \text{Score}(\mathbf{x}_i) &= w_0 h_0(\mathbf{x}_i) + w_1 h_1(\mathbf{x}_i) + \dots + w_D h_D(\mathbf{x}_i) \\ &= \sum_{j=0}^D w_j h_j(\mathbf{x}_i) = \mathbf{w}^T \mathbf{h}(\mathbf{x}_i) \end{aligned}$$

feature 1 = $h_0(\mathbf{x})$... e.g., 1

feature 2 = $h_1(\mathbf{x})$... e.g., $\mathbf{x}[1] = \text{\#awesome}$

feature 3 = $h_2(\mathbf{x})$... e.g., $\mathbf{x}[2] = \text{\#awful}$

or, $\log(\mathbf{x}[7]) \mathbf{x}[2] = \log(\text{\#bad}) \times \text{\#awful}$
or, tf-idf("awful")

...

feature $D+1 = h_D(\mathbf{x})$... some other function of $\mathbf{x}[1], \dots, \mathbf{x}[d]$

Sign (pos. #) = +1
Sign (neg. #) = -1

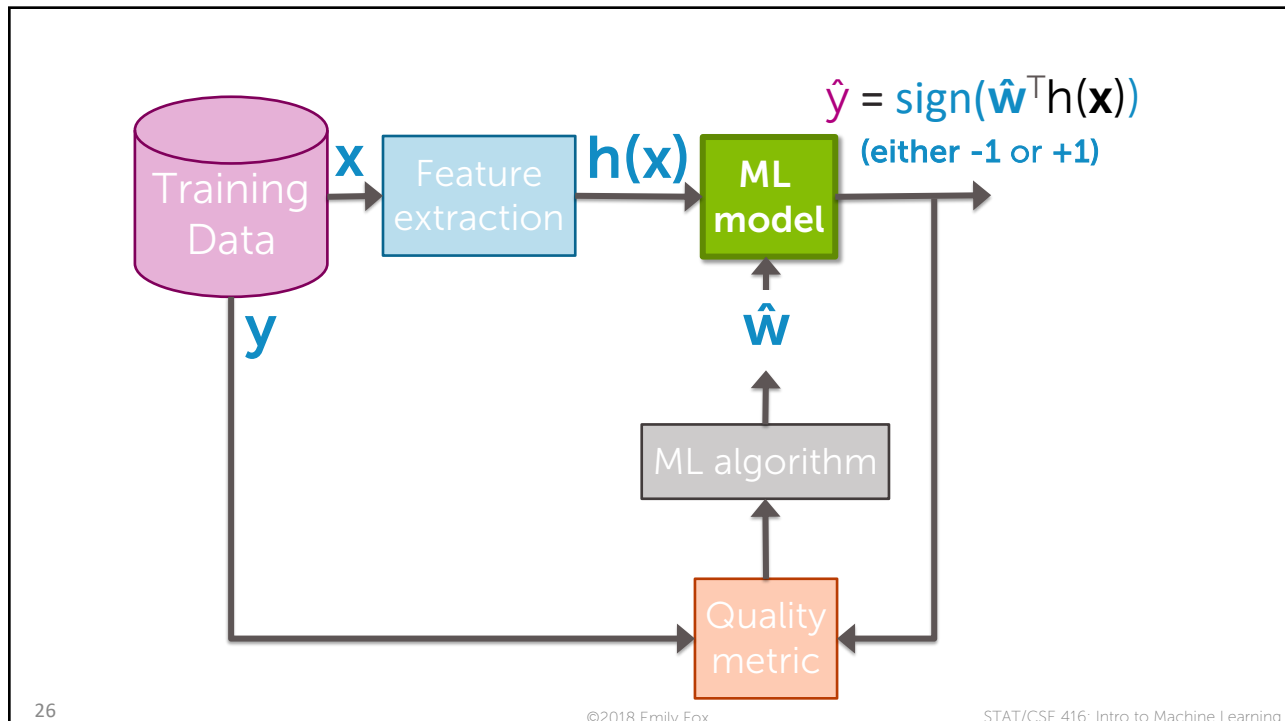

Sign (0.8) = +1

Sign (-1,627,000) = -1

25

STAT/CSE 416: Intro to Machine Learning

Decision boundaries

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Suppose only two words had non-zero coefficient

Input	Coefficient	Value
	w_0	0.0
#awesome	w_1	1.0
#awful	w_2	-1.5

$$\text{Score}(x) = 1.0 \# \text{awesome} - 1.5 \# \text{awful}$$

28

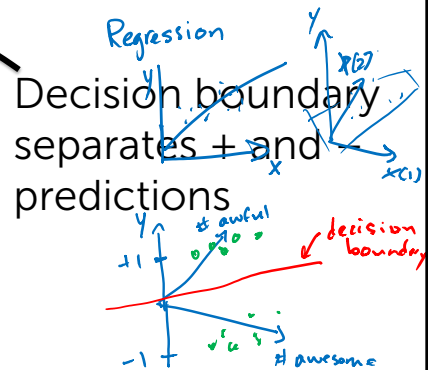

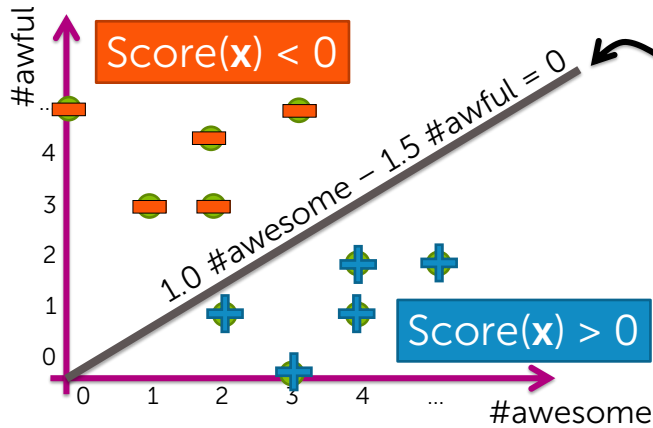

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Decision boundary example

Input	Coefficient	Value
	w_0	0.0
#awesome	w_1	1.0
#awful	w_2	-1.5

Score(x) = 1.0 #awesome - 1.5 #awful

29

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Decision boundary: effect of changing coefficients

Input	Coefficient	Value
	w_0	1.0
#awesome	w_1	1.0
#awful	w_2	-1.5

Score(x) = **1.0** #awesome - 1.5 #awful

30

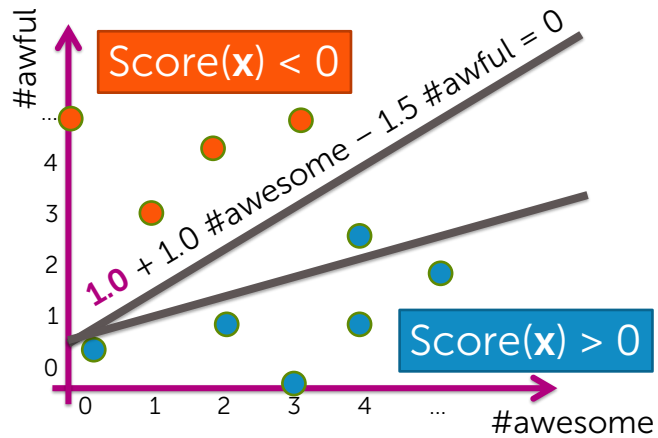

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Decision boundary: effect of changing coefficients

Input	Coefficient	Value
	w_0	1.0
#awesome	w_1	1.0
#awful	w_2	-3.0

$$\text{Score}(\mathbf{x}) = 1.0 + 1.0 \text{ #awesome} - 3.0 \text{ #awful}$$

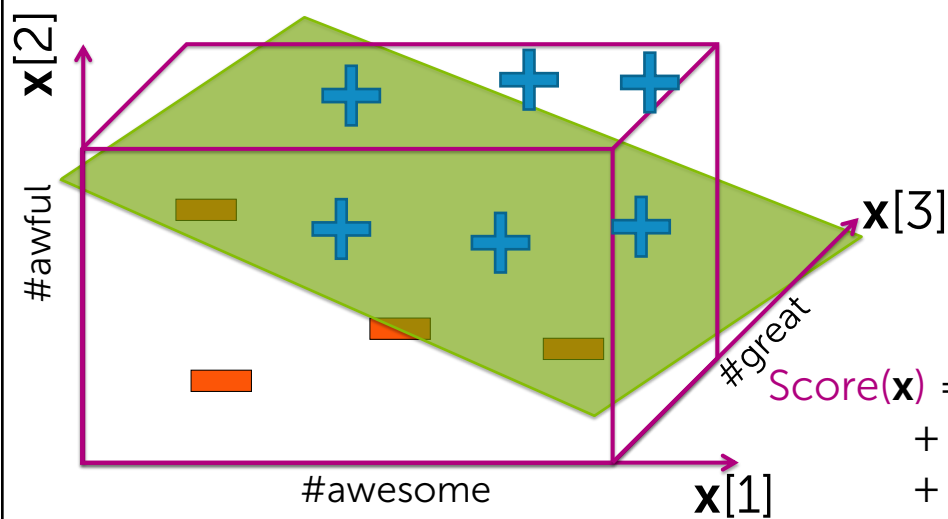

31

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

For more inputs (linear features)...

$$\begin{aligned} \text{Score}(\mathbf{x}) = & w_0 \\ & + w_1 \text{ #awesome} \\ & + w_2 \text{ #awful} \\ & + w_3 \text{ #great} \end{aligned}$$

32

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

For general features...

For more general classifiers (not just linear features)
→ more complicated shapes

33

STAT/CSE 416: Intro to Machine Learning

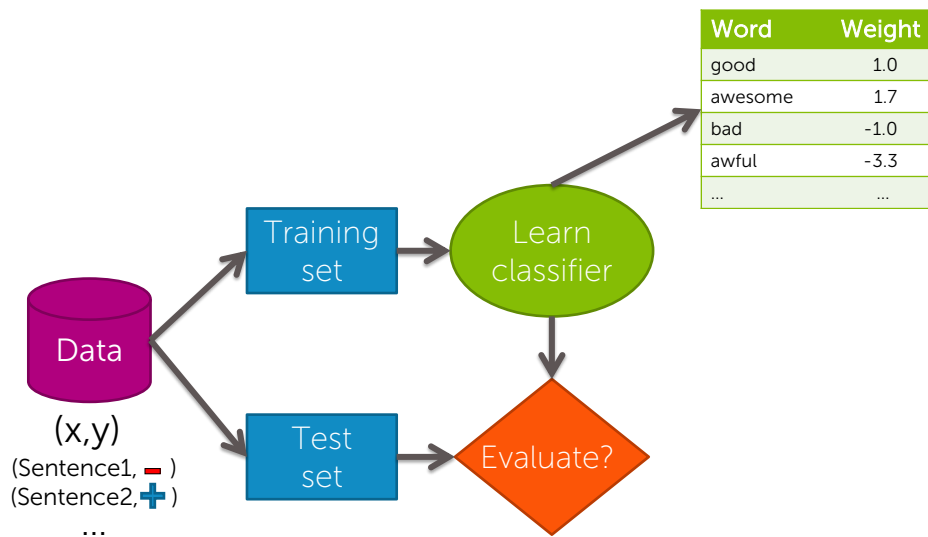

~~Training an~~ Training and evaluating a classifier

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Training a classifier = Learning the weights

Classification error

Learned classifier

$$\hat{y} = +$$

Test example

(\$ Esbi was great, +)

Mistake!

Correct	0
Mistakes	1

Hide label

37

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Classification error & accuracy

- Error measures fraction of mistakes

$$\text{error} = \frac{\# \text{ of mistakes}}{\text{Total } \# \text{ of sentences}}$$

test set

- Best possible value is 0.0

$$\text{error} = 1 - \text{accuracy}$$

- Often, measure **accuracy**
 - Fraction of correct predictions

$$\text{accuracy} = \frac{\# \text{ of correct}}{\text{Total } \# \text{ of sentences}}$$

- Best possible value is 1.0

38

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

What's a good accuracy?

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

What if you ignore the sentence, and just guess?

- For binary classification:
 - Half the time, you'll get it right! (on average)
 - accuracy = 0.5
- For k classes, accuracy = $1/k$
 - 0.333 for 3 classes, 0.25 for 4 classes,...

At the very, very, very least,
you should healthily beat random...
Otherwise, it's (usually) pointless...

40

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Is a classifier with 90% accuracy good? Depends...

2010 data shows:
"90% emails sent are spam!"

Predicting every email is spam
gets you 90% accuracy!!!

Majority class prediction

Amazing performance when
there is class imbalance
(but silly approach)

- One class is more common than others
- Beats random (if you know the majority class)

41

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

So, always be digging in and asking the hard questions about reported accuracies

- Is there **class imbalance**?
- How does it compare to a **simple, baseline approach**?
 - Random guessing
 - Majority class
 - ...
- Most importantly:
 - What accuracy does my application need?*
 - What is good enough for my user's experience?
 - What is the impact of the mistakes we make?

42

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

False positives, false negatives, and confusion matrices

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Types of mistakes

		Predicted label	
			
True label		True Positive	False Negative (FN)
		False Positive (FP)	True Negative

44

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Cost of different types of mistakes can be different (& high) in some applications

	Spam filtering	Medical diagnosis
False negative	Annoying	Disease not treated ↑ depends
False positive	Email lost higher cost	Wasteful treatment

45

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Confusion matrix – binary classification

100 test examples

		Predicted label	
		+	-
True label	+	60	10
	-	5	35

accuracy = $\frac{50+35}{100} = 0.85$

46

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Confusion matrix – multiclass classification

100 test examples

		Predicted label		
		Healthy	Cold	Flu
True label	Healthy 70	60	8	2
	Cold 20	4	12	4
	Flu 10	0	2	8

Accuracy = $\frac{80}{100} = 0.8$

47

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Learning curves (again):
How much data do I need?

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

How much data does a model need to learn?

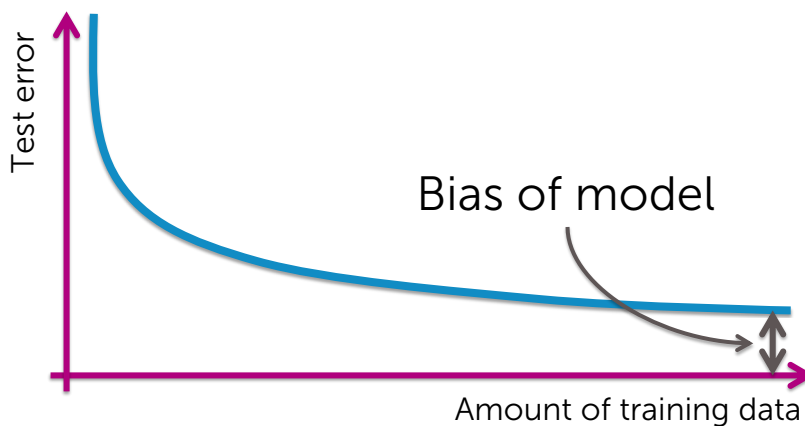

- The **more the merrier** 😊
 - But data **quality is most important** factor
- **Theoretical techniques** can sometimes bound how much data is needed
 - **Typically too loose for practical application**
 - But provide guidance
- In practice:
 - **More complex models require more data**
 - Empirical analysis can provide guidance

49

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Test error vs. amount of training data

even with infinite data, test error will not go to 0

50

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

More complex models tend to have less bias...

Sentiment classifier using single words can do OK, but...

Never classifies correctly:
"The sushi was not good."

More complex model:
consider pairs of words (bigrams)

Word	Weight
good	+1.5
not good	-2.1

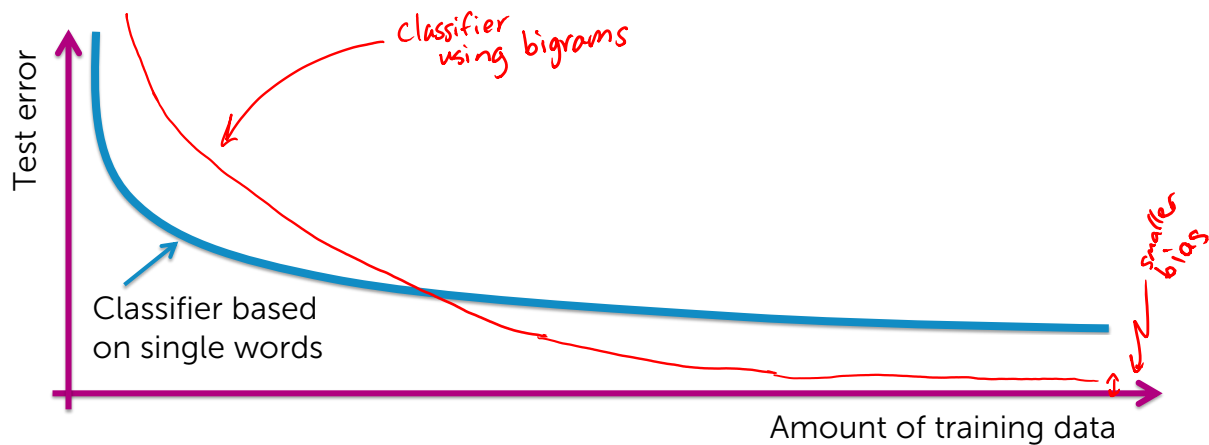

Less bias →
potentially more accurate,
needs more data to learn

51

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Models with less bias tend to need more data to learn well, but do better with sufficient data

52

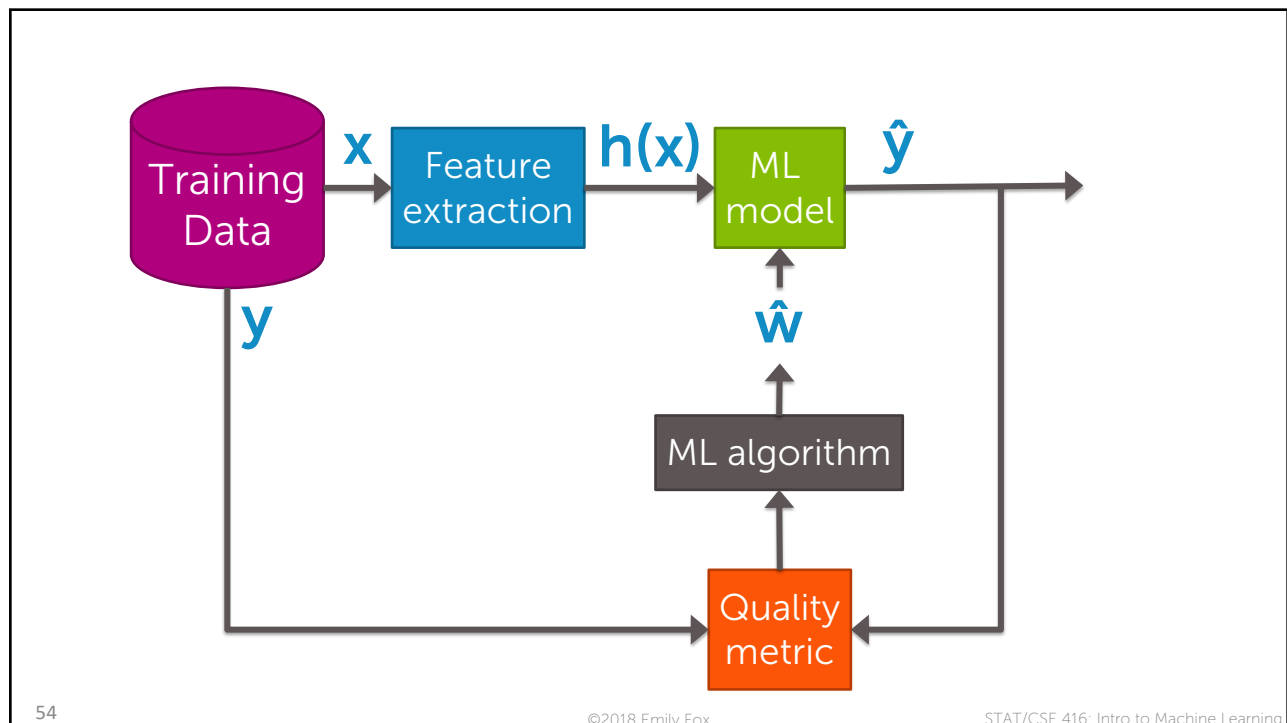

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Summary of classification intro

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

54

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

What you can do now...

- Identify a classification problem and some common applications
- Describe decision boundaries and linear classifiers
- Train a classifier
- Measure its error
 - Some rules of thumb for good accuracy
- Interpret the types of error associated with classification
- Describe the tradeoffs between model bias and data set size

55

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Linear classifiers:

Logistic regression

Are you sure about the prediction? Class probability

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

How confident is your prediction?

- Thus far, we've outputted a prediction **+1** or **-1**
- But, how sure are you about the prediction?

*"The sushi & everything
else were awesome!"*

Definite **+1**

*"The sushi was good,
the service was OK"*

Not sure

58

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Using probabilities in classification

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

How confident is your prediction?

"The sushi & everything
else were awesome!"

Definite **+1**

$$P(y=+1|\mathbf{x}=\text{"The sushi & everything else were awesome!"}) = 0.99$$

"The sushi was good,
the service was OK"

Not sure

$$P(y=+1|\mathbf{x}=\text{"The sushi was good, the service was OK"}) = 0.55$$

Many classifiers provide a degree of certainty:

Output label

$P(y|\mathbf{x})$

Input sentence

Extremely useful in practice

60

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Goal: Learn conditional probabilities from data

Training data: N observations (\mathbf{x}_i, y_i)

x[1] = #awesome	x[2] = #awful	y = sentiment
2	1	+1
0	2	-1
3	3	-1
4	1	+1
...

Optimize **quality metric**
on training data

Find best model \hat{P}
by finding best \hat{w}

Useful for predicting \hat{y}

61

©2018 Emily Fox

STAT/CSE 416: Intro to Machine Learning

Sentence
from
review

Input: \mathbf{x}

Predict most likely class

$\hat{P}(y|\mathbf{x})$ = estimate of class probabilities

If $\hat{P}(y=+1|\mathbf{x}) > 0.5$:

$\hat{y} = +1$

Else:

$\hat{y} = -1$

Estimating $\hat{P}(y|\mathbf{x})$ improves **interpretability**:

– Predict $\hat{y} = +1$ **and** tell me how sure you are

62
