

# CSE 417 Algorithms and Complexity

Autumn 2020  
Lecture 11  
Dijkstra's algorithm

## Upcoming lectures

- Topics
  - Dijkstra's Algorithm (Section 4.4)
  - Monday: Minimum Spanning Trees
- Reading
  - 4.4, 4.5, 4.7, 4.8

## Single Source Shortest Path Problem

- Given a graph and a start vertex  $s$ 
  - Determine distance of every vertex from  $s$
  - Identify shortest paths to each vertex
    - Express concisely as a "shortest paths tree"
    - Each vertex has a pointer to a predecessor on shortest path

## Construct Shortest Path Tree from $s$

## Warmup

- If  $P$  is a shortest path from  $s$  to  $v$ , and if  $t$  is on the path  $P$ , the segment from  $s$  to  $t$  is a shortest path between  $s$  and  $t$

- WHY?

Assume all edges have non-negative cost

## Dijkstra's Algorithm

```

S = {}; d[s] = 0; d[v] = infinity for v != s
While S != V
  Choose v in V-S with minimum d[v]
  Add v to S
  For each w in the neighborhood of v
    d[w] = min(d[w], d[v] + c(v, w))
  
```

## Simulate Dijkstra's algorithm (starting from s) on the graph

Round	Vertex Added	s	a	b	c	d
1						
2						
3						
4						
5						

## Who was Dijkstra?

- What were his major contributions?

<http://www.cs.utexas.edu/users/EWD/>

- Edsger Wybe Dijkstra was one of the most influential members of computing science's founding generation. Among the domains in which his scientific contributions are fundamental are
  - algorithm design
  - programming languages
  - program design
  - operating systems
  - distributed processing
  - formal specification and verification
  - design of mathematical arguments

## Dijkstra's Algorithm as a greedy algorithm

- Elements committed to the solution by order of minimum distance

## Correctness Proof

- Elements in S have the correct label
- Key to proof: when v is added to S, it has the correct distance label.

## Proof

- Let v be a vertex in V-S with minimum  $d[v]$
- Let  $P_v$  be a path of length  $d[v]$ , with an edge  $(u,v)$
- Let P be some other path to v. Suppose P first leaves S on the edge  $(x, y)$ 
  - $P = P_{sx} + c(x,y) + P_{yv}$
  - $\text{Len}(P_{sx}) + c(x,y) \geq d[y]$
  - $\text{Len}(P_{yv}) \geq 0$
  - $\text{Len}(P) \geq d[y] + 0 \geq d[v]$

## Negative Cost Edges

- Draw a small example a negative cost edge and show that Dijkstra's algorithm fails on this example

## Dijkstra Implementation

```
S = {}; d[s] = 0; d[v] = infinity for v != s
While S != V
  Choose v in V-S with minimum d[v]
  Add v to S
  For each w in the neighborhood of v
    d[w] = min(d[w], d[v] + c(v, w))
```

- Basic implementation requires Heap for tracking the distance values
- Run time  $O(m \log n)$

## $O(n^2)$ Implementation for Dense Graphs

```
FOR i := 1 TO n
  d[i] := Infinity; visited[i] := FALSE;
d[s] := 0;

FOR i := 1 TO n
  v := -1; dMin := Infinity;
  FOR j := 1 TO n
    IF visited[j] = FALSE AND d[j] < dMin
      v := j; dMin := d[j];

  IF v = -1
    RETURN;
  visited[v] := TRUE;

  FOR j := 1 TO n
    IF d[v] + len[v, j] < d[j]
      d[j] := d[v] + len[v, j];
      prev[j] := v;
```

## Bottleneck Shortest Path

- Define the bottleneck distance for a path to be the maximum cost edge along the path

## Compute the bottleneck shortest paths

How do you adapt Dijkstra's algorithm to handle bottleneck distances

- Does the correctness proof still apply?
