- Store this value in an auxiliary array
- Use to reconstruct solution

## Alternate approach for Subset Sum

- Alternate formulation of Subset Sum dynamic programming algorithm
- Sum $[i, K]=$ true if there is a subset of $\left\{\mathrm{w}_{1}, \ldots \mathrm{w}_{\mathrm{i}}\right\}$ that sums to exactly K , false otherwise
$-\operatorname{Sum}[i, K]=\operatorname{Sum}[i-1, K]$ OR Sum[i $\left.-1, K-w_{i}\right]$
- Sum $[0,0]=$ true; Sum $[i, 0]=$ false for $i!=0$
- To allow for negative numbers, we need to fill in the array between $\mathrm{K}_{\text {min }}$ and $\mathrm{K}_{\text {max }}$

28

## Run time for Subset Sum

- With $n$ items and target sum K , the run time is $\mathrm{O}(\mathrm{nK})$
- If K is $1,000,000,000,000,000,000,000,000$ this is very slow
- Alternate brute force algorithm: examine all subsets: $\mathrm{O}\left(\mathrm{n}^{2}{ }^{\mathrm{n}}\right)$
