

# CSE 417 Algorithms and Complexity

Autumn 2020 Lecture 27 Network Flow Applications NP-Completeness

#### Announcements

- · Homework 9
- · Exam practice problems on course homepage
- Final Exam: Monday, December 14
  - 24 hour take home exam
  - Target: 2 to 4 hours of work time

Wed, Dec 2	Net Flow Applications		
Fri, Dec 4	Net Flow Applications + NP-Completeness		
Mon, Dec 7	NP-Completeness		
Wed, Dec 9	NP-Completeness		
Fri, Dec 11	Beyond NP-Completeness		
Mon, Dec 14	Final Exam		

#### **Problem Reduction**

- · Reduce Problem A to Problem B
  - Convert an instance of Problem A to an instance of Problem R
  - Use a solution of Problem B to get a solution to Problem A
- Practical
  - Use a program for Problem B to solve Problem A
- · Theoretical
  - Show that Problem B is at least as hard as Problem A

# Minimum Cut Applications

- Image Segmentation
- Open Pit Mining / Task Selection Problem
- · Reduction to Min Cut problem

S, T is a cut if S, T is a partition of the vertices with s in S and t in T

The capacity of an S, T cut is the sum of the capacities of all edges going from S to T  $\,$ 

## **Image Segmentation**

 Separate foreground from background

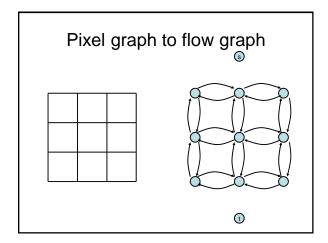

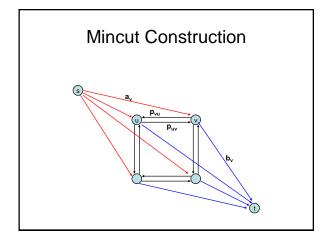

# Image analysis

- a<sub>i</sub>: value of assigning pixel i to the foreground
- b<sub>i</sub>: value of assigning pixel i to the background
- $p_{ij}$ : penalty for assigning i to the foreground, j to the background or vice versa
- · A: foreground, B: background
- Q(A,B) =  $\Sigma_{\{i \text{ in A}\}}a_i + \Sigma_{\{j \text{ in B}\}}b_j \Sigma_{\{(i,j) \text{ in E, } i \text{ in A, } j \text{ in B}\}}p_{ij}$

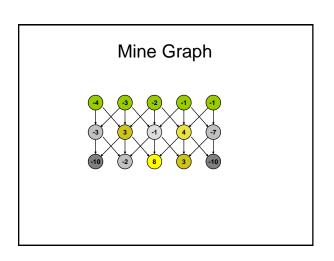

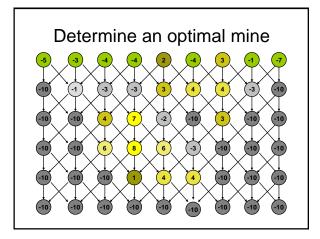

# Open Pit Mining

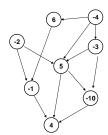

- Each unit of earth has a profit (possibly negative)
- Getting to the ore below the surface requires removing the dirt above
- Test drilling gives reasonable estimates of costs
- Plan an optimal mining operation

#### Generalization

- Precedence graph G=(V,E)
- Each v in V has a profit p(v)
- A set F is feasible if when w in F, and (v,w) in E, then v in F.
- Find a feasible set to maximize the profit

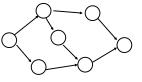

# Min cut algorithm for profit maximization

 Construct a flow graph where the minimum cut identifies a feasible set that maximizes profit

# Precedence graph construction

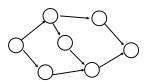

- Precedence graph G=(V,E)
- Each edge in E has infinite capacity
- · Add vertices s, t
- Each vertex in V is attached to s and t with finite capacity edges

Find a finite value cut with at least two vertices on each side of the cut

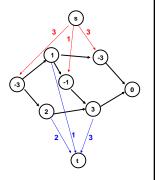

# The sink side of a finite cut is a feasible set

- No edges permitted from S to T
- If a vertex is in T, all of its ancestors are in T

## Setting the costs

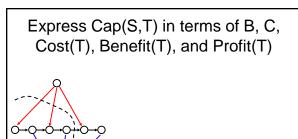

- If p(v) > 0,
  - cap(v,t) = p(v)
  - cap(s,v) = 0
- If p(v) < 0
  - cap(s,v) = -p(v)
  - cap(v,t) = 0
- If p(v) = 0
  - cap(s,v) = 0
  - cap(v,t) = 0

# Minimum cut gives optimal solution Why?

# Computing the Profit

- $Cost(W) = \sum_{\{w \text{ in } W; p(w) < 0\}} -p(w)$
- Benefit(W) =  $\Sigma_{\{w \text{ in W; p(w) > 0}\}} p(w)$
- Profit(W) = Benefit(W) Cost(W)
- · Maximum cost and benefit
  - -C = Cost(V)
  - -B = Benefit(V)

 $\begin{aligned} Cap(S,T) &= Cost(T) + Ben(S) = Cost(T) + Ben(S) + Ben(T) - Ben(T) \\ &= B + Cost(T) - Ben(T) = B - Profit(T) \end{aligned}$ 

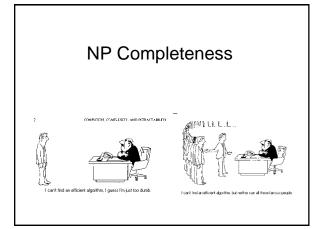

# **NP-Completeness**

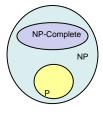

# Algorithms vs. Lower bounds

- Algorithmic Theory
  - What we can compute
    - I can solve problem X with resources R
  - Proofs are almost always to give an algorithm that meets the resource bounds
- Lower bounds
  - How do we show that something can't be done?

# Theory of NP Completeness

#### The Universe

#### Polynomial Time

- P: Class of problems that can be solved in polynomial time
  - Corresponds with problems that can be solved efficiently in practice
  - Right class to work with "theoretically"

#### **Decision Problems**

- Theory developed in terms of yes/no problems
  - Independent set
    - Given a graph G and an integer K, does G have an independent set of size at least K
  - Network Flow
    - Given a graph G with edge capacities, a source vertex s, and sink vertex t, and an integer K, does the graph have flow function with value at least K

#### Definition of P

Decision problems for which there is a polynomial time algorithm

Problem	Description	Algorithm	Yes	No
MULTIPLE	Is x a multiple of y?	Grade school division	51, 17	51, 16
RELPRIME	Are x and y relatively prime?	Euclid's algorithm	34, 39	34, 51
PRIMES	Is x prime?	Agrawal, Kayal, Saxena (2002)	53	51
EDIT- DISTANCE	Is the edit distance between x and y less than 5?	Dynamic programming	niether neither	acgggt ttttta
LSOLVE	Is there a vector x that satisfies Ax = b?	Gaussian elimination	0 1 1 4 2 4 -2 4 2 36	1 0 0 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

#### What is NP?

- Problems solvable in non-deterministic polynomial time . . .
- Problems where "yes" instances have polynomial time checkable certificates

#### Certificate examples

- · Independent set of size K
  - The Independent Set
- · Satifisfiable formula
  - Truth assignment to the variables
- · Hamiltonian Circuit Problem
  - A cycle including all of the vertices
- · K-coloring a graph
  - Assignment of colors to the vertices

# Certifiers and Certificates: 3-Satisfiability

SAT: Does a given CNF formula have a satisfying formula

Certificate: An assignment of truth values to the n boolean variables

Certifier: Check that each clause has at least one true literal

instance s

$$(\overline{x_1} \lor x_2 \lor x_3) \land (x_1 \lor \overline{x_2} \lor x_3) \land (x_1 \lor x_2 \lor x_4) \land (\overline{x_1} \lor \overline{x_3} \lor \overline{x_4})$$

certificate t

 $x_1 = 1, x_2 = 1, x_3 = 0, x_4 = 1$ 

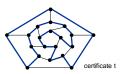

# Certifiers and Certificates: Hamiltonian Cycle

HAM-CYCLE. Given an undirected graph G = (V, E), does there exist a simple cycle C that visits every node?

Certificate. A permutation of the n nodes.

Certifier. Check that the permutation contains each node in V exactly once, and that there is an edge between each pair of adjacent nodes in the permutation.

## Polynomial time reductions

- · Y is Polynomial Time Reducible to X
  - Solve problem Y with a polynomial number of computation steps and a polynomial number of calls to a black box that solves X
  - Notations:  $Y <_P X$

# Composability Lemma

• If  $X <_P Y$  and  $Y <_P Z$  then  $X <_P Z$ 

#### Lemmas

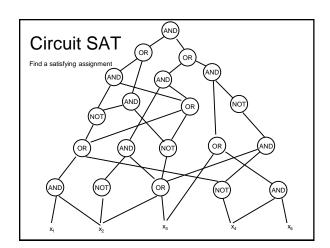

- Suppose Y <<sub>P</sub> X. If X can be solved in polynomial time, then Y can be solved in polynomial time.
- Suppose Y <<sub>P</sub> X. If Y cannot be solved in polynomial time, then X cannot be solved in polynomial time.

#### **NP-Completeness**

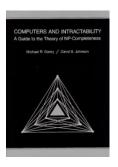

- · A problem X is NP-complete if
  - -X is in NP
  - For every Y in NP,  $Y <_P X$
- X is a "hardest" problem in NP
- If X is NP-Complete, Z is in NP and X <<sub>P</sub> Z
   Then Z is NP-Complete

#### Cook's Theorem

 The Circuit Satisfiability Problem is NP-Complete

# Garey and Johnson

## History

Jack Edmonds

Steve Cook

Dick Karp

 Identified the "standard" collection of NP-Complete Problems

- Cook's Theorem - NP-Completeness

Leonid Levin

- Independent discovery of NP-Completeness in USSR
