

**CSE 417**  
**Algorithms and Complexity**  
 Autumn 2024  
 Lecture 10 – Greedy Algorithms III

1

### Announcements

- Today's lecture
  - Kleinberg-Tardos, 4.3, 4.4
- Friday
  - Kleinberg-Tardos, 4.4, 4.5
- Text book has lots of details on some of the proofs that I cover quickly

2

### Greedy Algorithms

- Solve problems with the simplest possible algorithm
- Today's problems (Sections 4.3, 4.4)
  - Another homework scheduling task
  - Optimal Caching
- Start Dijkstra's shortest paths algorithm

3

### Scheduling Theory

- Tasks
  - Execution time, value, release time, deadline
- Processors
  - Single processor, multiple processors
- Objective Function – many options, e.g.
  - Maximize tasks completed
  - Minimize number of processors to complete all tasks
  - Minimize the maximum lateness
  - Maximize value of tasks completed by deadline

4

### Homework Scheduling

- Each task has a length  $t_i$  and a deadline  $d_i$
- All tasks are available at the start
- One task may be worked on at a time
- All tasks must be completed

- Goal minimize maximum lateness
  - Lateness:  $L_i = f_i - d_i$  if  $f_i \geq d_i$

5

### Result: Earliest Deadline First is Optimal for Min Max Lateness

	Time	Deadline	Lateness A <sub>1</sub>	Lateness A <sub>2</sub>
a <sub>1</sub>		6	0	3
a <sub>2</sub>		4	1	0
a <sub>3</sub>		5	4	2
a <sub>4</sub>		12	2	2

6

## Another version of HW scheduling

- Assign values to HW units
- Maximize value completed by deadlines
- Simplifying assumptions
  - All Homework item take one unit of time
  - All items available at time 0
  - Each item has an integer deadline
  - Each item has a value
  - Maximize value of items completed before their deadlines

7

## Example

Task	Value	Deadline
T <sub>1</sub>	2	2
T <sub>2</sub>	3	2
T <sub>3</sub>	4	4
T <sub>4</sub>	4	4
T <sub>5</sub>	5	4
T <sub>6</sub>	1	6
T <sub>7</sub>	1	6
T <sub>8</sub>	6	6

What is the maximum value of tasks you can complete by their deadlines?  
What do you do first?

8

## Problem transformation

- Convert to an equivalent problem with release times and a uniform deadline
- If  $D$  is the latest deadline, set  $r'_i$  as  $D - d_i$  and  $d'_i$  as  $D$

9

## Greedy Algorithm

- Starting from  $t = 0$ , schedule the highest value available task

```
S = ∅;
for i = 0 to D - 1
  Add tasks with release time i to S;
  Remove highest value task t from S;
  Schedule task t at i;
```

10

## Correctness argument

- Show that the item at  $t = 1$  is scheduled correctly
  - The argument can be repeated for  $t=2, 3, \dots$
  - Or the argument can be put in the framework of mathematical induction

11

## First item scheduled is correct

- Let  $t$  be the task scheduled at  $i = 1$ , then there exists an optimal schedule with  $t$  at  $i = 1$
- Suppose  $\text{Opt} = \{a_1, a_2, a_3, \dots\}$  is an optimal schedule:
  - Case 1:  $t = a_1$
  - Case 2:  $t \notin \text{Opt}$
  - Case 3:  $t \neq a_1$  and  $t \in \text{Opt}$

12

## Interpretation

- The transformation was done so that we could think about the first item to schedule, as opposed to the last item to schedule
- In the original problem with deadlines, this is asking “what task do I do last”
  - So this is a procrastination based approach!

13

## Optimal Caching

- Memory Hierarchy
  - Fast Memory (RAM)
  - Slow Memory (DISK)
  - Move big blocks of data from DISK to RAM for processing
- Caching problem:
  - Maintain collection of items in local memory
  - Minimize number of items fetched

14

## Caching example

A, B, C, D, A, E, B, A, D, A, C, B, D, A

15

## Optimal Caching

- If you know the sequence of requests, what is the optimal replacement pattern?
- Note – it is rare to know what the requests are in advance – but we still might want to do this:
  - Some specific applications, the sequence is known
    - Register allocation in code generation
  - Competitive analysis, compare performance on an online algorithm with an optimal offline algorithm

16

## Farthest in the future algorithm

- Discard element used farthest in the future

A, B, C, A, C, D, C, B, C, A, D

17

## Correctness Proof

- Sketch
- Start with Optimal Solution O
- Convert to Farthest in the Future Solution F-F
- Look at the first place where they differ
- Convert O to evict F-F element
  - There are some technicalities here to ensure the caches have the same configuration . . .

18

19

### Single Source Shortest Path Problem

- Given a graph and a start vertex  $s$ 
  - Determine distance of every vertex from  $s$
  - Identify shortest paths to each vertex
    - Express concisely as a "shortest paths tree"
    - Each  $v$  vertex has a pointer to a predecessor on shortest path

20

### Construct Shortest Path Tree from $s$

21

### Warmup

- If  $P$  is a shortest path from  $s$  to  $v$ , and if  $t$  is on the path  $P$ , the segment from  $s$  to  $t$  is a shortest path between  $s$  and  $t$

- WHY?

22

**Assume all edges have non-negative cost**

### Dijkstra's Algorithm

$S = \{ \}; d[s] = 0; d[v] = \text{infinity for } v \neq s$   
 While  $S \neq V$   
   Choose  $v$  in  $V-S$  with minimum  $d[v]$   
   Add  $v$  to  $S$   
   For each  $w$  in the neighborhood of  $v$   
      $d[w] = \min(d[w], d[v] + c(v, w))$

23

### Simulate Dijkstra's algorithm (starting from $s$ ) on the graph

Round	Vertex Added	s	a	b	c	d
