The Network Flow Problem

2

The Network Flow Problem

How much stuff can flow from s to t?

3

Net Flow: Formal Definition

Given:

A digraph  $G = (V, E)$   
Two vertices  $s, t$  in  $V$   
(source & sink)

A **capacity**  $c(u, v) \geq 0$   
for each  $(u, v) \in E$   
(and  $c(u, v) = 0$  for all non-edges  $(u, v)$ )

Find:

A **flow function**  $f: V \times V \rightarrow \mathbb{R}$  s.t.,  
for all  $u, v$ :

- $f(u, v) \leq c(u, v)$  [Capacity Constraint]
- $f(u, v) = -f(v, u)$  [Skew Symmetry]
- if  $u \neq s, t$ ,  $f(u, V) = 0$  [Flow Conservation]

Maximizing total flow  $|f| = f(s, V)$

Notation:

$$f(X, Y) = \sum_{x \in X} \sum_{y \in Y} f(x, y)$$

4

Example: A Flow Function

$$f(s, u) = f(u, t) = 2$$

$$f(u, s) = f(t, u) = -2 \text{ (Why?)}$$

$$f(s, t) = -f(t, s) = 0 \text{ (In every flow function for this G. Why?)}$$

$$f(u, V) = \sum_{v \in V} f(u, v) = f(u, s) + f(u, t) = -2 + 2 = 0$$

5

## Example: A Flow Function

- Not shown:  $f(u,v)$  if  $\leq 0$
- Note: max flow  $\geq 4$  since  $f$  is a flow function, with  $|f| = 4$

6

## Max Flow via a Greedy Alg?

- While there is an  $s \rightarrow t$  path in  $G$   
 Pick such a path,  $p$   
 Find  $c_p$ , the min capacity of any edge in  $p$   
 Subtract  $c_p$  from all capacities on  $p$   
 Delete edges of capacity 0

7

## Max Flow via a Greedy Alg?

This does **NOT** always find a max flow:  
 If you pick  $s \rightarrow b \rightarrow a \rightarrow t$  first,

Flow stuck at 2. But flow 3 possible.

8

## A Brief History of Flow

| #  | year | discoverer(s)        | bound                             |
|----|------|----------------------|-----------------------------------|
| 1  | 1861 | Buatang              | $O(n^2 m U)$                      |
| 2  | 1955 | Ford & Fulkerson     | $O(m U^2)$                        |
| 3  | 1970 | Dinitz               | $O(m n^2)$                        |
| 4  | 1970 | Edmonds & Karp       | $O(n^2 m)$                        |
| 5  | 1972 | Dinitz               | $O(n^2 \log U)$                   |
| 6  | 1972 | Edmonds & Karp       | $O(m^2 \log U)$                   |
| 6  | 1973 | Dinitz               | $O(m \log U)$                     |
| 6  | 1973 | Gabow                | $O(m \log U)$                     |
| 7  | 1974 | Karzanov             | $O(n^3)$                          |
| 8  | 1977 | Chekanov             | $O(n^2 \sqrt{m})$                 |
| 9  | 1980 | Gall & Naamad        | $O(m \log n)$                     |
| 10 | 1983 | Shenoi & Tarjan      | $O(m \log n)$                     |
| 11 | 1986 | Goldberg & Tarjan    | $O(m \log(n^2/m))$                |
| 12 | 1987 | Aluja & Orlin        | $O(m + n^2 \log U)$               |
| 13 | 1987 | Ahuja et al.         | $O(m \log(n \log U) / (m+2))$     |
| 14 | 1989 | Cheriyani & Hagerup  | $E(m + n^2 \log^2 n)$             |
| 15 | 1990 | Cheriyani et al.     | $O(n^2 \log n)$                   |
| 16 | 1990 | Ahuja                | $O(m + n^2 \log(n))$              |
| 17 | 1992 | King et al.          | $O(m + n^{2.5})$                  |
| 18 | 1993 | Phillips & Westbrook | $O(m \log(n/n + \log^{2.5} n))$   |
| 19 | 1994 | King et al.          | $O(m \log(n \log(n \log n)))$     |
| 20 | 1997 | Goldberg & Rao       | $O(m^2 \log(n^2/m) \log U)$       |
|    |      |                      | $O(n^{2.5} m \log(n^2/m) \log U)$ |

$n$  = # of vertices  
 $m$  = # of edges  
 $U$  = Max capacity

Source: Goldberg & Rao, FOCS '97

10

## Greed Revisited

12

## Residual Capacity

• The *residual capacity* (w.r.t.  $f$ ) of  $(u,v)$  is  $c_f(u,v) = c(u,v) - f(u,v)$

• E.g.:

$$c_f(s,b) = 7;$$

$$c_f(a,x) = 1;$$

$$c_f(x,a) = 3;$$

$$c_f(x,t) = 0 \text{ (a saturated edge)}$$

13

## Residual Networks & Augmenting Paths

• The *residual network* (w.r.t.  $f$ ) is the graph  $G_f = (V, E_f)$ , where

$$E_f = \{ (u,v) \mid c_f(u,v) > 0 \}$$

• An *augmenting path* (w.r.t.  $f$ ) is a simple  $s \rightarrow t$  path in  $G_f$ .

14

## A Residual Network

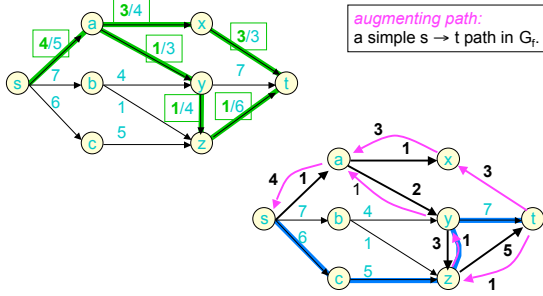

*residual network*: the graph  $G_f = (V, E_f)$ , where  $E_f = \{ (u,v) \mid c_f(u,v) > 0 \}$

15

## An Augmenting Path

16

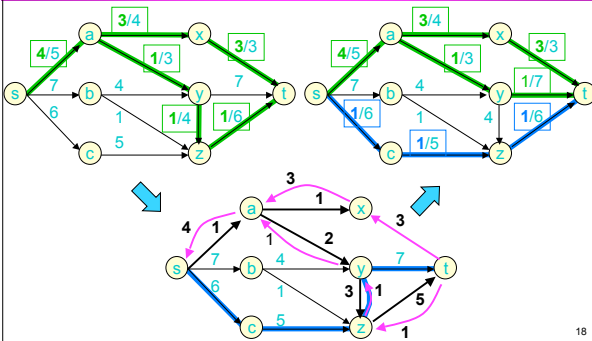

## Lemma 1

If  $f$  admits an augmenting path  $p$ , then  $f$  is not maximal.

Proof: "obvious" -- augment along  $p$  by  $c_p$ , the min residual capacity of  $p$ 's edges.

17

## Augmenting A Flow

18

## Lemma 1': Augmented Flows are Flows

If  $f$  is a flow &  $p$  an augmenting path of capacity  $c_p$ , then  $f'$  is also a valid flow, where

$$f'(u, v) = \begin{cases} f(u, v) + c_p, & \text{if } (u, v) \text{ in path } p \\ f(u, v) - c_p, & \text{if } (v, u) \text{ in path } p \\ f(u, v), & \text{otherwise} \end{cases}$$

Proof:

- a) Flow conservation -- easy
- b) Skew symmetry -- easy
- c) Capacity constraints -- pretty easy

19

## Lma 1': Augmented Flows are Flows

$$f'(u,v) = \begin{cases} f(u,v) + c_p, & \text{if } (u,v) \text{ in path } p \\ f(u,v) - c_p, & \text{if } (v,u) \text{ in path } p \\ f(u,v), & \text{otherwise} \end{cases}$$

If  $f$  a flow &  $p$  an aug path of cap  $c_p$ , then  $f'$  also a valid flow.

Proof (Capacity constraints):

$(u,v), (v,u)$  not on path: no change

$(u,v)$  on path:

$$\begin{aligned} f'(u,v) &= f(u,v) + c_p & f'(v,u) &= f(v,u) - c_p \\ &\leq f(u,v) + c_r(u,v) & &< f(v,u) \\ &= f(u,v) + c(u,v) - f(u,v) & &\leq c(v,u) \\ &= c(u,v) \end{aligned}$$

Residual Capacity:  
 $0 < c_p \leq c_r(u,v) = c(u,v) - f(u,v)$   
 Cap Constraints:  
 $-c(v,u) \leq f(u,v) \leq c(u,v)$

20

## Lemma 1' Example – Case 1

Let  $(u,v)$  be any edge in augmenting path. Note

$$c_r(u,v) = c(u,v) - f(u,v) \geq c_p > 0$$

Case 1:  $f(u,v) \geq 0$ :

Add forward flow

21

## Lemma 1' Example – Case 2

Let  $(u,v)$  be any edge in augmenting path. Note  $c_r(u,v) = c(u,v) - f(u,v) \geq c_p > 0$

Case 2:  $f(u,v) \leq -c_p$ :  
 $f(v,u) = -f(u,v) \geq c_p$

Cancel/redirect reverse flow

22

## Lemma 1' Example – Case 3

Let  $(u,v)$  be any edge in augmenting path. Note  $c_r(u,v) = c(u,v) - f(u,v) \geq c_p > 0$

Case 3:  $-c_p < f(u,v) < 0$ :

???

23

## Lemma 1' Example – Case 3

Let  $(u,v)$  be any edge in augmenting path. Note  $c_f(u,v) = c(u,v) - f(u,v) \geq c_p > 0$

Case 3:  $-c_p < f(u,v) < 0$   
 $c_p > f(v,u) > 0$ :

Both:  
 cancel/redirect reverse flow  
 and  
 add forward flow

24

## Ford-Fulkerson Method

While  $G_f$  has an augmenting path, augment

Questions:

- » Does it halt?
- » Does it find a maximum flow?
- » How fast?

25

## Cuts

- A partition  $S, T$  of  $V$  is a *cut* if  $s \in S, t \in T$
- *Capacity* of cut  $S, T$  is  $c(S, T) = \sum_{u \in S, v \in T} c(u, v)$

26

## Lemma 2

- For any flow  $f$  and any cut  $S, T$ ,
  - the net flow across the cut equals the total flow, i.e.,  $|f| = f(S, T)$ , and
  - the net flow across the cut cannot exceed the capacity of the cut, i.e.  $f(S, T) \leq c(S, T)$

Corollary:  
 Max flow  $\leq$  Min cut

27

## Max Flow / Min Cut Theorem

For any flow  $f$ , the following are equivalent

- (1)  $|f| = c(S,T)$  for some cut  $S,T$  (a min cut)
- (2)  $f$  is a maximum flow
- (3)  $f$  admits no augmenting path

Proof:

- (1)  $\Rightarrow$  (2): corollary to lemma 2
- (2)  $\Rightarrow$  (3): contrapositive of lemma 1

28

(3)  $\Rightarrow$  (1)

Idea: where's bottleneck

$S = \{ u \mid \exists \text{ an augmenting path wrt } f \text{ from } s \text{ to } u \}$   
 $T = V - S; s \in S, t \in T$

For any  $(u,v)$  in  $S \times T$ ,  $\exists$  an augmenting path from  $s$  to  $u$ , but **not** to  $v$ .

$\therefore (u,v)$  has 0 residual capacity:

$(u,v) \in E \Rightarrow \text{saturated} \quad f(u,v) = c(u,v)$   
 $(v,u) \in E \Rightarrow \text{no flow} \quad f(u,v) = 0 = -f(v,u)$

This is true for every edge crossing the cut, i.e.

$$|f| = f(S,T) = \sum_{u \in S} \sum_{v \in T} f(u,v) = \sum_{u \in S, v \in T, (u,v) \in E} f(u,v) = \sum_{u \in S, v \in T, (u,v) \in E} c(u,v) = c(S,T) \quad 29$$

## Corollaries & Facts

- If Ford-Fulkerson terminates, then it's found a max flow.
- It will terminate if  $c(e)$  integer or rational (but may not if they're irrational).
- However, may take exponential time, even with integer capacities:

30

## Edmonds-Karp Algorithm

- Use a **shortest** augmenting path (via Breadth First Search in residual graph)
- Time:  $O(n m^2)$

31

## BFS/Shortest Path Lemmas

Distance from  $s$  is never reduced by:

- **Deleting** an edge  
proof: no new (hence no shorter) path created
- **Adding** an edge  $(u,v)$ , **provided**  $v$  is nearer than  $u$   
proof: BFS is unchanged, since  $v$  visited before  $(u,v)$  examined

32

## Lemma 3

Let  $f$  be a flow,  $G_f$  the residual graph, and  $p$  a shortest augmenting path. Then no vertex is closer to  $s$  after augmentation along  $p$ .

Proof: Augmentation only deletes edges, adds back edges

33

## Augmentation vs BFS

34

## Theorem 2

The Edmonds-Karp Algorithm performs  $O(mn)$  flow augmentations

Proof:

$\{u,v\}$  is **critical** on augmenting path  $p$  if it's closest to  $s$  having min residual capacity. Won't be critical again until farther from  $s$ . So each edge critical at most  $n$  times.

35

## Augmentation vs BFS Level

## Corollary

Edmonds-Karp runs in  $O(nm^2)$

37

## Flow Integrality Theorem

If all capacities are integers

- » The max flow has an integer value
- » Ford-Fulkerson method finds a max flow in which  $f(u,v)$  is an integer for all edges  $(u,v)$

A valid flow, but unnecessary

38

## Bipartite Maximum Matching

Bipartite Graphs:

- $G = (V, E)$
- $V = L \cup R$  ( $L \cap R = \emptyset$ )
- $E \subseteq L \times R$

Matching:

- A set of edges  $M \subseteq E$  such that no two edges touch a common vertex

Problem:

- Find a matching  $M$  of maximum size

39

## Reducing Matching to Flow

Given bipartite  $G$ , build flow network  $N$  as follows:

- Add source  $s$ , sink  $t$
- Add edges  $s \rightarrow L$
- Add edges  $R \rightarrow t$
- All edge capacities 1

**Theorem:**  
Max flow iff  
max matching

40

## Reducing Matching to Flow

**Theorem:** Max matching size = max flow value

$M \rightarrow f$ ? Easy – send flow only through  $M$   
 $f \rightarrow M$ ? Flow integrality Thm, + cap constraints

41

## Notes on Matching

- Max Flow Algorithm is probably overly general here
- But most direct matching algorithms use "augmenting path" type ideas similar to that in max flow – See text & homework
- Time  $mn^{1/2}$  possible via Edmonds-Karp

42
