The Network Flow Problem

The Network Flow Problem

How much stuff can flow from s to t?

Net Flow: Formal Definition

Given:

A digraph $G = (V, E)$

Two vertices s, t in V
(**source & sink**)

A **capacity** $c(u, v) \geq 0$
for each $(u, v) \in E$
(and $c(u, v) = 0$ for all non-edges (u, v))

Find:

A **flow function** $f: V \times V \rightarrow \mathbb{R}$ s.t.,
for all u, v :

- $f(u, v) \leq c(u, v)$ [Capacity Constraint]
- $f(u, v) = -f(v, u)$ [Skew Symmetry]
- if $u \neq s, t$, $f(u, V) = 0$ [Flow Conservation]

Maximizing total flow $|f| = f(s, V)$

Notation:

$$f(X, Y) = \sum_{x \in X} \sum_{y \in Y} f(x, y)$$

Example: A Flow Function

$$f(s,u) = f(u,t) = 2$$

$$f(u,s) = f(t,u) = -2 \quad (\text{Why?})$$

$$f(s,t) = -f(t,s) = 0 \quad (\text{In every flow function for this } G. \text{ Why?})$$

$$f(u,V) = \sum_{v \in V} f(u,v) = f(u,s) + f(u,t) = -2 + 2 = 0$$

Example: A Flow Function

- Not shown: $f(u,v)$ if ≤ 0
- Note: $\max \text{ flow} \geq 4$ since f is a flow function, with $|f| = 4$

Max Flow via a Greedy Alg?

- While there is an $s \rightarrow t$ path in G
- Pick such a path, p
- Find c_p , the min capacity of any edge in p
- Subtract c_p from all capacities on p
- Delete edges of capacity 0

Max Flow via a Greedy Alg?

This does **NOT** always find a max flow:
If you pick $s \rightarrow b \rightarrow a \rightarrow t$ first,

Flow stuck at 2. But flow 3 possible.

A Brief History of Flow

#	year	discoverer(s)	bound
1	1951	Dantzig	$O(n^2 m U)$
2	1955	Ford & Fulkerson	$O(n m U)$
3	1970	Dinitz Edmonds & Karp	$O(n m^2)$
4	1970	Dinitz	$O(n^2 m)$
5	1972	Edmonds & Karp Dinitz	$O(m^2 \log U)$
6	1973	Dinitz Gabow	$O(n m \log U)$
7	1974	Karzanov	$O(n^3)$
8	1977	Cherkassky	$O(n^2 \sqrt{m})$
9	1980	Galil & Naamad	$O(n m \log^2 n)$
10	1983	Sleator & Tarjan	$O(n m \log n)$
11	1986	Goldberg & Tarjan	$O(n m \log(n^2/m))$
12	1987	Ahuja & Orlin	$O(n m + n^2 \log U)$
13	1987	Ahuja et al.	$O(n m \log(n \sqrt{\log U} / (m + 2)))$
14	1989	Cheriyani & Hagerup	$E(n m + n^2 \log^2 n)$
15	1990	Cheriyani et al.	$O(n^3 / \log n)$
16	1990	Alon	$O(n m + n^{8/3} \log n)$
17	1992	King et al.	$O(n m + n^{2+\epsilon})$
18	1993	Phillips & Westbrook	$O(n m (\log_{m/n} n + \log^{2+\epsilon} n))$
19	1994	King et al.	$O(n m \log_{m/(n \log n)} n)$
20	1997	Goldberg & Rao	$O(m^{3/2} \log(n^2/m) \log U)$ $O(n^{2/3} m \log(n^2/m) \log U)$

n = # of vertices
 m = # of edges
 U = Max capacity

Greed Revisited

Residual Capacity

- The *residual capacity* (w.r.t. f) of (u,v) is $c_f(u,v) = c(u,v) - f(u,v)$

- E.g.:

$$c_f(s,b) = 7;$$

$$c_f(a,x) = 1;$$

$$c_f(x,a) = 3;$$

$$c_f(x,t) = 0 \text{ (a saturated edge)}$$

Residual Networks & Augmenting Paths

- The *residual network* (w.r.t. f) is the graph $G_f = (V, E_f)$, where

$$E_f = \{ (u, v) \mid c_f(u, v) > 0 \}$$

- An *augmenting path* (w.r.t. f) is a simple $s \rightarrow t$ path in G_f .

A Residual Network

residual network: the graph
 $G_f = (V, E_f)$, where
 $E_f = \{ (u,v) \mid c_f(u,v) > 0 \}$

An Augmenting Path

augmenting path:
a simple $s \rightarrow t$ path in G_f .

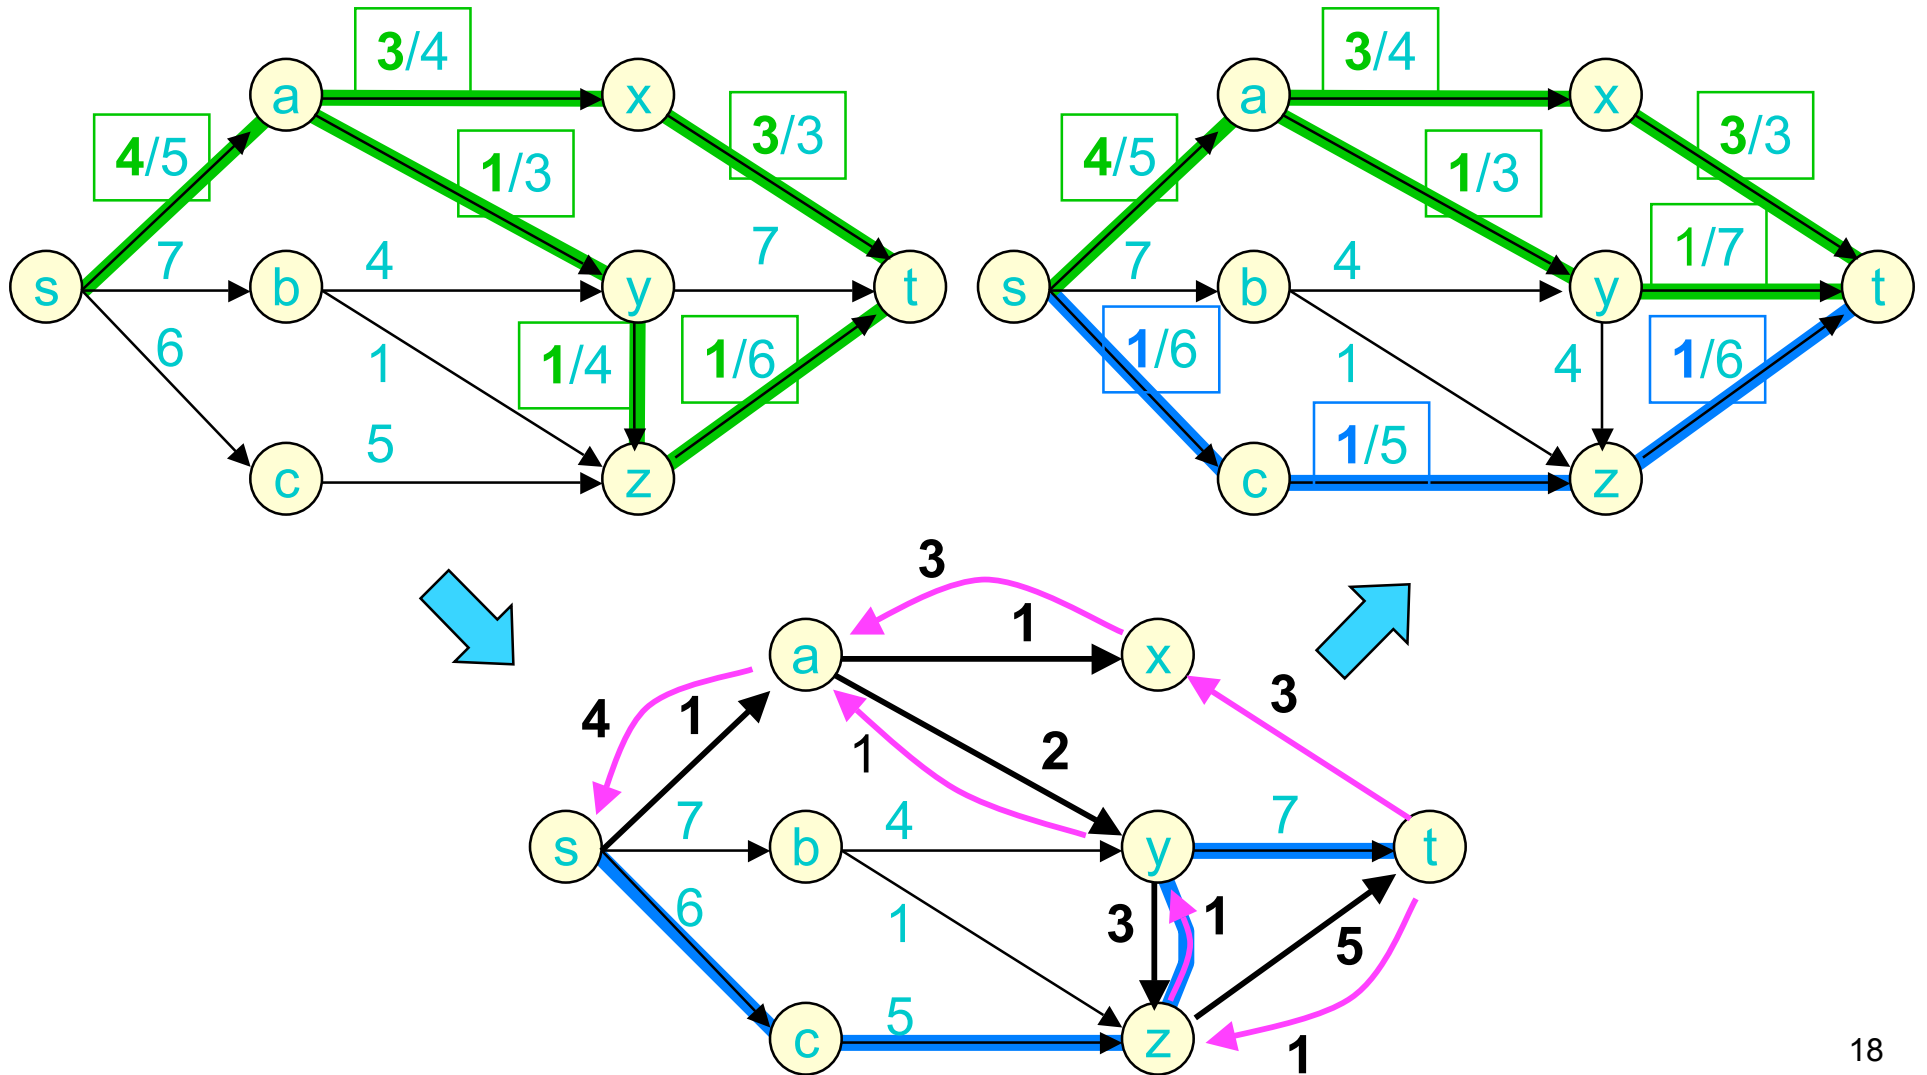

Lemma 1

If f admits an augmenting path p , then f is not maximal.

Proof: “obvious” -- augment along p by c_p , the min residual capacity of p 's edges.

Augmenting A Flow

Lemma 1':

Augmented Flows are Flows

If f is a flow & p an augmenting path of capacity c_p , then f' is also a valid flow, where

$$f'(u, v) = \begin{cases} f(u, v) + c_p, & \text{if } (u, v) \text{ in path } p \\ f(u, v) - c_p, & \text{if } (v, u) \text{ in path } p \\ f(u, v), & \text{otherwise} \end{cases}$$

Proof:

- a) Flow conservation -- easy
- b) Skew symmetry -- easy
- c) Capacity constraints – pretty easy

Lma 1': Augmented Flows are Flows

$$f'(u,v) = \begin{cases} f(u,v) + c_p, & \text{if } (u,v) \text{ in path } p \\ f(u,v) - c_p, & \text{if } (v,u) \text{ in path } p \\ f(u,v), & \text{otherwise} \end{cases}$$

f a flow & p an aug path of cap c_p , then f' also a valid flow.

Proof (Capacity constraints):

$(u,v), (v,u)$ not on path: no change

(u,v) on path:

$$f'(u,v) = f(u,v) + c_p$$

$$\leq f(u,v) + c_f(u,v)$$

$$= f(u,v) + c(u,v) - f(u,v)$$

$$= c(u,v)$$

$$f'(v,u) = f(v,u) - c_p$$

$$< f(v,u)$$

$$\leq c(v,u)$$

Residual Capacity:

$$0 < c_p \leq c_f(u,v) = c(u,v) - f(u,v)$$

Cap Constraints:

$$-c(v,u) \leq f(u,v) \leq c(u,v)$$

Lemma 1' Example – Case 1

Let (u,v) be any edge in augmenting path. Note

$$c_f(u,v) = c(u,v) - f(u,v) \geq c_p > 0$$

Case 1: $f(u,v) \geq 0$:

Add forward flow

Lemma 1' Example – Case 2

Let (u,v) be any edge in augmenting path. Note $c_f(u,v) = c(u,v) - f(u,v) \geq c_p > 0$

Case 2: $f(u,v) \leq -c_p$:
 $f(v,u) = -f(u,v) \geq c_p$

Cancel/redirect
reverse flow

Lemma 1' Example – Case 3

Let (u,v) be any edge in augmenting path. Note $c_f(u,v) = c(u,v) - f(u,v) \geq c_p > 0$

Case 3: $-c_p < f(u,v) < 0$:

???

Lemma 1' Example – Case 3

Let (u,v) be any edge in augmenting path. Note $c_f(u,v) = c(u,v) - f(u,v) \geq c_p > 0$

Case 3: $-c_p < f(u,v) < 0$
 $c_p > f(v,u) > 0$:

Both:
 cancel/redirect
 reverse flow
 and
 add forward flow

Ford-Fulkerson Method

While G_f has an augmenting path,
augment

Questions:

- » Does it halt?
- » Does it find a maximum flow?
- » How fast?

Cuts

- A partition S, T of V is a *cut* if $s \in S, t \in T$
- *Capacity* of cut S, T is $c(S, T) = \sum_{\substack{u \in S \\ v \in T}} c(u, v)$

Lemma 2

- For any flow f and any cut S, T ,
 - the net flow across the cut equals the total flow, i.e., $|f| = f(S, T)$, and
 - the net flow across the cut cannot exceed the capacity of the cut, i.e. $f(S, T) \leq c(S, T)$

- Corollary:
Max flow \leq Min cut

Max Flow / Min Cut Theorem

For any flow f , the following are equivalent

- (1) $|f| = c(S,T)$ for some cut S,T (a min cut)
- (2) f is a maximum flow
- (3) f admits no augmenting path

Proof:

- (1) \Rightarrow (2): corollary to lemma 2
- (2) \Rightarrow (3): contrapositive of lemma 1

(3) \Rightarrow (1)

$S = \{ u \mid \exists \text{ an augmenting path wrt } f \text{ from } s \text{ to } u \}$

$T = V - S; s \in S, t \in T$

For any (u,v) in $S \times T$, \exists an augmenting path from s to u , but **not** to v .

$\therefore (u,v)$ has 0 residual capacity:

$(u,v) \in E \Rightarrow$ saturated $f(u,v) = c(u,v)$

$(v,u) \in E \Rightarrow$ no flow $f(u,v) = 0 = -f(v,u)$

This is true for every edge crossing the cut, i.e.

$$|f| = f(S,T) = \sum_{u \in S} \sum_{v \in T} f(u,v) =$$

$$\sum_{u \in S, v \in T, (u,v) \in E} f(u,v) = \sum_{u \in S, v \in T, (u,v) \in E} c(u,v) = c(S,T)$$

Idea: where's bottleneck

Corollaries & Facts

- If Ford-Fulkerson terminates, then it's found a max flow.
- It will terminate if $c(e)$ integer or rational (but may not if they're irrational).
- However, may take exponential time, even with integer capacities:

Edmonds-Karp Algorithm

- Use a **shortest** augmenting path
(via Breadth First Search in residual graph)
- Time: $O(n m^2)$

BFS/Shortest Path Lemmas

Distance from s is never reduced by:

- **Deleting** an edge
proof: no new (hence no shorter) path created
- **Adding** an edge (u,v) , **provided** v is nearer than u
proof: BFS is unchanged, since v visited before (u,v) examined

Lemma 3

Let f be a flow, G_f the residual graph, and p a shortest augmenting path. Then no vertex is closer to s after augmentation along p .

Proof: Augmentation only deletes edges, adds back edges

Augmentation vs BFS

Theorem 2

The Edmonds-Karp Algorithm performs $O(mn)$ flow augmentations

Proof:

$\{u, v\}$ is **critical** on augmenting path p if it's closest to s having min residual capacity.

Won't be critical again until farther from s .

So each edge critical at most n times.

Augmentation vs BFS Level

Corollary

Edmonds-Karp runs in $O(nm^2)$

Flow Integrality Theorem

If all capacities are integers

- » The max flow has an integer value
- » Ford-Fulkerson method finds a max flow in which $f(u,v)$ is an integer for all edges (u,v)

A valid flow,
but unnecessary

Bipartite Maximum Matching

Bipartite Graphs:

- $G = (V, E)$
- $V = L \cup R$ ($L \cap R = \emptyset$)
- $E \subseteq L \times R$

Matching:

- A set of edges $M \subseteq E$ such that no two edges touch a common vertex

Problem:

- Find a matching M of maximum size

Reducing Matching to Flow

Given bipartite G , build flow network N as follows:

- Add source s , sink t
- Add edges $s \rightarrow L$
- Add edges $R \rightarrow t$
- All edge capacities 1

Theorem:

Max flow iff
max matching

Reducing Matching to Flow

Theorem: Max matching size = max flow value

$M \rightarrow f$? Easy – send flow only through M

$f \rightarrow M$? Flow integrality Thm, + cap constraints

Notes on Matching

- Max Flow Algorithm is probably overly general here
- But most direct matching algorithms use "augmenting path" type ideas similar to that in max flow – See text & homework
- Time $mn^{1/2}$ possible via Edmonds-Karp
